Amazon CEO wants to put ads in your Alexa+ conversations

Maxwell Zeff — 4:34 PM PDT · July 31, 2025

IMAGE CREDITS:

MICHAEL NAGLE/BLOOMBERG / GETTY IMAGES

Amazon CEO Andy Jassy sees an opportunity to deliver ads to users during their conversations with the company's AI-powered digital assistant, [Alexa+](#), he said during Amazon's second-quarter earnings call Thursday.

"People are excited about the devices that they can buy from us that has Alexa+ enabled in it. People do a lot of shopping [with Alexa+]; it's a delightful shopping experience that will keep getting better," said Jassy on the call with investors and Wall Street analysts. "I think over time, there will be opportunities, as people are engaging in more multi-turn conversations, to have advertising play a role to help people find discovery, and also as a lever to drive revenue."

Amazon says it has rolled out Alexa+ to millions of customers, part of an effort to make its legacy digital assistant capable of agentic behaviors and more natural to talk to. Alexa+ is Amazon's answer to generative AI voice assistants from [OpenAI](#), [Google](#), and [Perplexity](#) that have made legacy systems feel outdated. However, the business models behind generative AI products remain unclear.

Amazon has made Alexa+ free for Prime customers (who pay \$14.99 a month) and added a \$20-a-month subscription tier for Alexa+ on its own. Jassy suggested on Thursday that Alexa+ could eventually include subscription tiers beyond what's available today — perhaps an ad-free tier.

Up until now, ads have only appeared in Alexa in limited ways. Users may occasionally see a visual ad on Amazon's smart display device, the Echo Show, or hear a pre-recorded ad in between songs on one of Alexa's smart speakers.

But Jassy's description of an AI-generated ad that Alexa+ delivers in a multistep conversation, which

San Francisco | October 27-29, 2025

[REGISTER NOW](#)

Amazon is spending a fortune to catch up in the AI race. In the second quarter of 2025, Amazon's capital expenditures rose to \$31.4 billion, up 90% from the same period last year. A large part of that increased spending is to develop Amazon's in-house AI chips and build out data centers to support AI models. While the revenue of Amazon's cloud business, AWS, grew 18% in the second

quarter, the company likely needs to generate new business to pay for these investments.

Jassy is betting that users will talk to Alexa+ more than Alexa, which could drive more advertising and more shopping on Amazon.com. However, [early reviews](#) of Alexa+ have been mixed. Amazon has reportedly [struggled to ship](#) some of Alexa+'s more complicated features, and the rollout has been [slower than many expected](#).

There's a lot to figure out before Amazon puts ads in Alexa+. Like most AI models, Alexa+ is not immune to hallucinations. Before advertisers agree to make Alexa+ a spokesperson for their products, Amazon may have to come up with some ways to ensure that its AI will not offer false advertising for a product.

Jassy seems enthusiastic about making advertising a larger part of Amazon business. Amazon's advertising revenue went up 22% in the second quarter, compared to the same period last year.

Delivering ads in AI chatbot conversations may also raise privacy concerns. People tend to talk more with AI chatbots compared to deterministic assistants, like the traditional Alexa and Siri products. As a result, generative AI chatbots tend to collect more information on users. Some users might be unsettled by having that information sold to advertisers and having ads appear in their natural language conversations with AI.

First impressions of Alexa+, Amazon's upgraded, AI-powered digital assistant

Sarah Perez — 11:27 AM PDT · August 6, 2025

I owned a lot of Alexa-powered devices in my former home: There were Amazon Echos in most rooms, including an older Echo Plus in the living room, a smattering of Dots, a Spot in a bedroom, and an Echo Show in the kitchen. A Fire TV ran in the

Newsletters

[See More](#) ↗

bedroom. And, in a drawer, a rarely used Fire HD tablet sat collecting dust.

With the [total loss of the home due to a March 2024 house fire](#), there also came a new opportunity: We could now make a fresh start to create a more modernized smart home after rebuilding our house. But whether Alexa still deserves to be the center of our connected home remains to be seen.

To find out whether Alexa is still the best smart assistant for my family, I'm going to test Amazon's AI-powered devices, experiment with AI queries, and write out my thoughts in a multi-part series. With this series, I hope to offer consumers insights as to how well Alexa works in various real-world situations, not company demos.

Alexa needed to catch up

IMAGE CREDITS: AMAZON

Amazon's assistant, which once gave its users Star Trek vibes as they ordered their home computer to close the blinds or turn off the lights or order milk, no longer seems as revolutionary in the ChatGPT era. Today, people can engage with AI via text and voice chat. Modern AI chatbots and AI-powered services can answer so many more questions, are imaginative, can reason, can create images and art, and generate videos, and with the agentic AI, they can even perform online tasks on your behalf.

In February 2025, [Amazon announced a complete makeover of its digital voice assistant](#) with the arrival of Alexa+, powered by generative AI. That service began rolling out slowly to customers in March and is now available to “many millions” of users, Amazon says. The system is also model-agnostic, meaning Alexa+ can use whatever she needs in the moment to answer the question or complete the task. Alexa+ is using models from Anthropic and [Amazon Nova](#), among others.

The company teased that this improved Alexa could do more than set timers and alarms, control smart home devices, and answer questions. She leverages generative AI to make sense of information stored in Amazon users’ accounts, understand their schedules, and their preferences. She can remember things, process files, and summarize a Ring camera’s footage.

IMAGE CREDITS: AMAZON

Notably, Amazon says it’s been working with partners to allow it to take actions for people, like booking dinner reservations or Uber rides, or buying concert tickets. Integrations with Amazon’s own grocery service could also have it make shopping lists by speaking to it, and then have those products delivered. Essentially, it’s aiming to bring agentic AI into the home.

But before we can get to that, let’s see how Alexa+ handles the basics.

In the first part of this series, I'm going to set up Alexa+, use the app, and ask the assistant some questions that only the new Alexa+ can do. Later, I'll test the agentic AI features and smart home integrations.

Setting up Alexa+ on an Echo Spot

Device: Echo Spot

Default music service: Spotify (Premium)

Before moving to my new home, I put Alexa+ to the test on a brand-new Echo Spot after being accepted into the beta. Since I couldn't yet hook up smart home devices in the Airbnb that's served as a temporary residence for over a year, I initially tried to test the device's AI in other ways.

Mainly, I wanted to know if Alexa+ was really all that smart and useful, and if she could do all the things Amazon promised.

Setting up the Spot was easier than it was with past devices, as now you only need to scan a QR code to get the process started in the Alexa app. The app connected automatically to the home's Wi-Fi; no more weird toggling between the device's network and your own Wi-Fi.

On the next screen, I accepted the invite to upgrade to the new Alexa+ for free, knowing that it's still possible to downgrade to the old Alexa service at any time, if things go wrong.

Onboarding included a short video that explained that Alexa would learn more as I use her, and instructed me on how to talk to Alexa. I then connected my Google account, giving Alexa access to my inbox and calendar.

I ended up on a blank page after doing so, oddly, but after closing the window, the screen informed me that my "Account Linked." (Disclosure: I am running the iOS 26 developer beta on my iPhone, so maybe that's the problem?)

IMAGE CREDITS: ALEXA APP SCREENSHOT

On the following screen, I picked the services I wanted to use with Alexa+, which today include OpenTable, Ticketmaster, Uber, and Thumbtack. I checked all the boxes, then moved to the following screen to grant the necessary permissions, one by one.

While it's a bit tedious to do so — and something that could be even more tedious in time as more services are added — I did appreciate that it felt like I was in control of the data sharing and could see exactly what each service was requesting before agreeing.

IMAGE CREDITS: ALEXA APP SCREENSHOT

The following screen confirmed that Fodor's travel planning service was already integrated with Alexa+, but it didn't require permissions. It also noted that services like Uber Eats, Grubhub, and Vagaro would be added later on.

IMAGE CREDITS: ALEXA APP SCREENSHOT

The Alexa app itself is still sorely lacking in user interface design. Despite many updates, the app still feels somehow both plain and too busy. It lacks color and traditional mobile app navigation patterns, and it tries to cram too many examples of “things to do” on its home screen.

Meanwhile, trying to locate how to do the necessary first steps — like linking my preferred music service — is buried in the interface. Nope, you don’t tap on your profile icon, Settings, and then scroll down to “Preferred service providers.” For some reason, that’s where you set your preferred News, Calendar,

and Email providers, but not your preferred Music service.

IMAGE CREDITS: ALEXA APP SCREENSHOT

Instead, you tap on the hamburger menu at the bottom of the screen. You then tap on the “Music & More” screen. (What’s the “More”? Podcasts? Audiobooks?)

IMAGE CREDITS: ALEXA APP SCREENSHOT

I set Spotify as my default music service, the default choice for artists and genre stations, and the default for podcasts. There was no option to set my default audiobooks service.

In this section, there was also a list of services I had previously linked with Alexa. Here, Amazon's Audible — which I would prefer to set as the default for audiobooks — was listed alongside other streamers, like Pandora, Amazon Music, Apple Music, and others. But when I tapped on Audible, I simply got an error that says “You’ve reached the end of Alexa’s knowledge. Just kidding. This skill no longer exists. Click here to go back.”

Uh, OK. I mean, would it not make sense to just *remove the broken thing* that no longer exists?

IMAGE CREDITS: ALEXA APP SCREENSHOT

In any event, I'm here to try Alexa+, not yell at a poorly designed mobile app.

I'll figure out audiobooks later, I guess.

Note for this series:

In these tests, I may have shared personal information with Alexa that I will not be publishing. In those cases, I will put a description of the item — like “child’s school” — in [brackets]. I have also slightly changed some of the dates, times, and

numbers to further obscure any personal information that could be used to develop an understanding of my accounts, meetings, or household routines.

Can Alexa+ manage the family's schedule?

Busy households, especially ones with kids, often use a family calendar to track activities, doctor's appointments, errands, meetings, classes, and more. Our family calendar is maintained in Google Calendar, accessed on our phones through the native Google Calendar app, and on Mac desktops via the calendar app Fantastical.

Amazon suggests that Alexa+ can help summarize your day, add new events to your calendar, identify conflicts, and more.

In practice, Alexa was fairly adept at letting me inquire about the schedule and various events, but she interrupted me when I was asking to add a new meeting to my calendar. I said, "Can you add a meeting to my calendar on August 6 at 2 p.m. with [entity] about—" Here she cut me off to ask, "What would you like to title this meeting?"

Annoying, but not end-of-the-world terrible, I suppose.

I was more easily able to ask things like "What's on my calendar today?" and follow up to ask further questions — like if there were any meetings later in the week or to repeat one of the appointments. I didn't have to say "Alexa" again to continue the conversation. It felt more natural, but there's a very slight lag with her responses at times.

(As an aside, when I went to find the history of my voice chats for writing this post, I asked Alexa

where they could be found. She told me to look in the app's Settings under the More menu, then look for Alexa Privacy or Review Voice History. She's wrong. Neither option was there. I did, however, find my history from the "Recent Chats" link on the app's home screen. Alexa, c'mon! Know thyself.)

Alexa, remember this

Another thing Alexa+ is supposed to be able to do is store information on your behalf. To test this out, I asked her to remember my frequent flier number. This interaction went poorly.

Me: Alexa, can you remember my Delta SkyMiles number?

Alexa: Sure, I'd be happy to remember your Delta SkyMiles number for you. What's the number?

*Me: *opens mouth to speak**

Alexa: I've added that to Remember This in the Alexa privacy section of the app. Also, keep in mind that anyone who has access to any of your Alexa devices can use their voice to hear its contents.

Um, what? I tried again.

Me: Alexa, can you remember my SkyMiles number?

Alexa: Certainly! I'd be happy to remember your SkyMiles number for you. What's the number? OK, saved it.

She didn't even take a breath!

Curious, I asked her what she thinks the number is. She responded, "I don't have your SkyMiles number saved yet. Would you like to tell me your number now?"

Me: Yes.

Alexa: OK, go ahead and tell me your Delta SkyMiles number.

Me: [says the eight-digit number]

Alexa: OK, saved it.

Me: What's my SkyMiles number?

Alexa: "Six hundred fifty-two million, four hundred eighty-six thousand..."

(Note: I changed the number for the purpose of this post, but yes, Alexa read it out like a long numeral instead of just saying 6-5-2-4-8-6, etc. Not helpful!)

Alexa, read my email

Alexa: The recent email from [my child's school] is a welcome-back letter for the 2025-2026 school year. It announces an "Early Start Day" orientation on August [date] for new students, with an information session for new parents that evening. Regular classes begin on August [date].

Me: Was there any information specifically for [grade] in that email?

Alexa: I don't see any information specifically for [grade] in that email. The letter mainly covers general school information, orientation dates, and important deadlines for all students.

Yes, there are several important dates you should add to your calendar. The course correction request period is from August

IMAGE CREDITS: ALEXA APP SCREENSHOT

Great, that worked, it seems. But here's where things got a little trickier.

Me: Are there any important dates I should add to my calendar?

*Alexa: *repeats the important dates from above**

Me: Can you add those to my calendar for me?

Alexa: (Which must have misheard me?) Checking your calendar. Sarah, your calendar is looking busy. You have [activity] ongoing until August 16th, you have [activity]. On Thursday—

Me: (interrupting) I was asking if you could add the dates in the email to my calendar for me?

Alexa: Certainly, I'll do that. (Pause) I've added the following dates to your calendar:

- *Course Correction Request Period from August [date] through August [date]*
- *New Student Orientation Early Start Day on August [date, time]*
- *First Day of School on August [date]*

Is there anything else you'd like me to add?

While this process seems efficient and is certainly helpful in a pinch, you'll notice I left it up to Alexa to determine which dates were "important." As a result, she picked the three dates closest to today. The email itself, however, contained a list of 12 important school dates, including things like Meet the Teacher Night, Open House, Midyear Graduation, and more.

All of them were formatted the same way in the email under the heading "Important Dates." Had I only relied on Alexa and had not read the email itself, I would have missed these.

Oh, dear.

Alexa, help me save money

Another Alexa+ promise is that she can help you track prices on Amazon so you can save money when things go on sale. All right, I'll bite! I like online shopping.

I decided to try tracking a couple of things, including one skin care item and a Coach handbag. These are things I definitely don't need, but want — the kinds of things where a discount could prompt a purchase.

AMAZON.COM SCREENSHOT .

Me: Alexa, I want to know when the Glow Recipe Plum Plumping and Hydrating Hyaluronic Acid Skin Care Serum goes on sale.

Alexa: Just a second ... I've set up a deal tracker for the Glow Recipe Plum Plumping Serum. I'll notify you when it goes on sale.

Me: How much is it right now?

*Alexa: *silence**

Me: Did you hear me?

Alexa: Checking on that. Yes, I heard you. I've already set up a deal tracker for the Glow Recipe Plum Plumping Serum. You'll get a notification when it goes on sale.

Me: How much is it now?

*Alexa: *More silence.**

OK, I guess we'll wait on that one.

Next up, I tried the handbag.

Me: Alexa, I want to know when the Coach Swinger handbag goes on sale.

Alexa: Certainly, I'll check that. Got it! I set up a deal tracker for the Coach Swinger handbag. I'll let you know when it goes on sale.

Me: Is it out of stock in blue?

*Alexa: *Silence**

Me: Is the Coach handbag I just asked you about out of stock in blue? (Note: It was, per Amazon's website at the time of the request.)

Alexa: Let me check that for you. (Long pause) I found the Coach Swinger handbag, but it's currently available in black. The blue option isn't showing up in the search results, which might mean it's out of stock. Would you like more details about the available options?

Me: No.

The Coach Swinger handbag in blue does show up on the product page on the web, for what it's worth; it's listed as "temporarily out of stock." The bag is also available in both black and red, but Alexa only mentioned the black option for some reason. Not super helpful.

And we'll have to wait to see if it ever goes on sale.

Off to a slow start

With these first introductory tests, Alexa+ seems very much like a beta product. She's trying but is prone to making mistakes and not being thorough. Sometimes, she doesn't even seem to hear me or doesn't know what to do.

Given that many of these are out-of-the-box features that don't require integrations, you have to wonder how well Alexa+ will do at navigating the web and taking action for you.

In the next installment of this series, I'll continue testing the AI and will try some of the agentic AI features with Alexa+.

OpenAI's GPT-5 is here

Maxwell Zeff — 10:00 AM PDT · August 7, 2025

GPT-5 Flagship model

OpenAI has launched GPT-5, a new flagship AI model that will power the company's next generation of ChatGPT.

GPT-5, which was released Thursday, is OpenAI's first "unified" AI model and combines the reasoning abilities of its o-series of models with the fast responses of its GPT series. The next-generation model signals a new era for ChatGPT — and its creator, OpenAI — pointing to OpenAI's broader ambitions to develop AI systems that are more like agents than chatbots.

While GPT-4 enabled AI chatbots to offer smart responses on a wide variety of questions, GPT-5 allows ChatGPT to complete a wide variety of tasks on behalf of users — such as generating software applications, navigating a user's calendar, or creating research briefs.

With GPT-5, OpenAI has also sought to make ChatGPT simpler to use. Instead of asking users to choose the right settings, GPT-5 comes equipped with a real-time router that decides how to offer the best answer, whether that's responding to user

questions quickly or taking additional time to “think” through answers.

IMAGE CREDITS: OPENAI

During a briefing with reporters, OpenAI CEO Sam Altman claimed GPT-5 is “the best model in the world,” and said it represented a “significant step” along the company’s path to developing AI that can outperform humans at most economically valuable work — that is, artificial general intelligence (AGI).

“Having something like GPT-5 would be pretty much unimaginable at any previous time in history,” said Altman.

Starting Thursday, GPT-5 will be available to all free users of ChatGPT as their default model. OpenAI’s VP of ChatGPT, Nick Turley, said this is part of the company’s effort to give free users access to an AI reasoning model for the first time. (Previously, the company gated these more advanced models behind a paywall.)

“This is just one of the ways that I’m excited to live the mission, making sure that this stuff actually benefits people,” said Turley on the decision, referencing OpenAI’s long-standing [mission](#) to distribute advanced AI to as many people as possible.

Tech and VC heavyweights join the Disrupt 2025 agenda

Netflix, ElevenLabs, Wayve, Sequoia Capital, Elad Gil — just a few of the heavy hitters joining the Disrupt 2025 agenda. They're here to deliver the insights that fuel startup growth and sharpen your edge. Don't miss the 20th anniversary of TechCrunch Disrupt, and a chance to learn from the top voices in tech — grab your ticket now and save up to \$600+ before prices rise.

San Francisco | October 27-29, 2025

[REGISTER NOW](#)

The expectations are high for GPT-5, one of OpenAI's most anticipated product launches since ChatGPT put the company on the map in 2022. Since then, ChatGPT has grown into one of the world's most popular consumer products, reaching more than 700 million users every week — nearly 10% of the globe's population, according to the company.

Many see GPT-5 as a bellwether for AI progress broadly, and the model's reception by Silicon Valley could have profound implications for Big Tech, Wall Street, and policymakers regulating technology. These stakeholders are watching to see if GPT-5 offers a significant jump in AI's capabilities, much like its predecessor, GPT-4, which challenged expectations of what software can do.

GPT-5 offers a slight edge on the competition

OpenAI claims GPT-5 is state-of-the-art in several domains, slightly edging out leading AI models from Anthropic, Google DeepMind, and Elon Musk's xAI on key benchmarks. However, GPT-5 slightly underperforms frontier AI models in other areas.

The company says GPT-5 offers frontier-level performance around coding; Altman said the model specifically excels at spinning up entire software applications on demand, in what's become known as "vibe coding."

On SWE-bench Verified — a test of real-world coding tasks pulled from GitHub — GPT-5 scores 74.9% on its first attempt. That means GPT-5 just outperforms Anthropic's latest Claude Opus 4.1 model, which scored [74.5%](#), and Google DeepMind's Gemini 2.5 Pro, which scored [59.6%](#).

On Humanity's Last Exam — a difficult test measuring AI model performance across math, humanities, and the natural sciences — a version of GPT-5 with extended reasoning (GPT-5 Pro) scored 42% when using tools. That's slightly less than xAI was able to achieve with [Grok 4 Heavy](#), which scored 44.4% on the test.

IMAGE CREDITS:OPENAI

On GPQA Diamond — a test of PhD-level science questions — GPT-5 pro scored 89.4% on its first try,

outperforming Claude Opus 4.1, which scored 80.9%, and Grok 4 Heavy, which scored 88.9%.

OpenAI says GPT-5 is better for answering health-related questions. On a test measuring accuracy in AI model responses around healthcare topics, HealthBench Hard Hallucinations, OpenAI says GPT-5 (with thinking) hallucinates just 1.6% of the time. This is far lower than the company's previous GPT-4o and o3 models, which scored 12.9% and 15.8, respectively.

While AI chatbots are not medical professionals, [millions of people](#) are using them for health advice. In response to this phenomenon, the company says GPT-5 is more proactive about flagging potential health concerns and helping users parse medical results.

In addition, OpenAI says GPT-5 is better than other AI models on more difficult-to-measure, [subjective domains](#), such as creative design and writing. Turley said GPT-5 responds more naturally and exhibits “better taste” than other AI models on creative tasks.

“The vibes of this model are really good,” said Turley.

GPT-5 is also more accurate than OpenAI's previous models, and the company says it suffers far less from hallucinations — the tendency for AI models to make up information — compared to its o-series models. Hallucinations seemed to be [getting worse](#) in OpenAI's latest AI reasoning models, such as o3, and OpenAI previously said it didn't quite understand why it was happening.

In responses to ChatGPT prompts, OpenAI found that GPT-5 (with thinking) hallucinates and responds with incorrect information 4.8% of the time. That's a significant reduction from o3 and

GPT-4o, which score hallucination rates of 22% and 20.6%, respectively, on the test.

On a benchmark measuring an AI model's agentic ability to complete simulated online tasks, Tau-bench, GPT-5 offers mixed performance. On part of the test measuring an AI's ability to navigate an airline's website, GPT-5 scores 63.5%, slightly underperforming o3, which scored 64.8%. On another part of the test measuring AI's ability to navigate retail websites, GPT-5 scores 81.1%, underperforming Claude Opus 4.1, which scored 82.4%.

OpenAI also says that GPT-5 is safer than its previous models. While AI reasoning models occasionally exhibit a tendency to [scheme against humans](#) or lie to promote their own goals, OpenAI found that GPT-5 was deceptive at a lower rate than other models.

Alex Beutel, OpenAI's safety research lead, said reducing deception improves not only the safety of GPT-5, but also the user experience, creating a model that's more "transparent and honest in ways users can trust."

Beutel also notes GPT-5 is better at discerning between bad actors who are trying to misuse ChatGPT and users making harmless requests. This results in GPT-5 being able to refuse more unsafe questions, while offering fewer rejections to users seeking harmless information.

Upgrades for consumers and developers

ChatGPT is getting a few user experience upgrades as part of the GPT-5 launch. Users can now select from four new personalities in ChatGPT's setting: Cynic, Robot, Listener, and Nerd. The company says

these will adapt ChatGPT's responses without requiring users to specifically ask the model to respond in a certain way.

Subscribers to ChatGPT's \$20-per-month Plus plan get higher usage limits for GPT-5 than free users. Meanwhile, \$200-per-month Pro subscribers will have unlimited access to GPT-5, as well as a souped-up version called GPT-5 Pro that uses additional computational resources to produce better answers. Organizations on OpenAI's Team, Edu, and Enterprise plans will gain access to GPT-5 as their default model next week.

For developers, GPT-5 is coming to OpenAI's API in three sizes — gpt-5, gpt-5-mini, and gpt-5-nano — which will spend more or less time “reasoning” through tasks. Developers can also now control verbosity in the OpenAI API, deciding how long or short an AI model's responses should be.

The base model of GPT-5 will cost developers \$1.25 per million input tokens (roughly 750,000 words, longer than the entire “Lord of the Rings” series) and \$10 per million output tokens.

The launch of GPT-5 comes after a busy week for OpenAI. The company released an open-weight reasoning model, [gpt-oss](#), that developers and enterprises can download for free and run at a fraction of the cost. The open model nearly matched the abilities of OpenAI's previous top models, o3 and o4-mini, but GPT-5 sets a new standard for frontier performance in some areas, such as coding.

However, GPT-5 seems to be roughly on par with other frontier AI models in several areas. Benchmarks, of course, only tell part of the story for any AI model, and it remains to be seen how developers will use GPT-5 in the real world, and

whether the model is truly a step above the competition.
