GitHub Copilot crosses 20M all-time users

Maxwell Zeff — 6:16 PM PDT · July 30, 2025

GitHub Copilot, an AI coding tool offered by Microsoft-owned GitHub, has now reached more than 20 million users, Microsoft CEO Satya Nadella said on the company's [earnings call](#) Wednesday. A GitHub spokesperson confirmed to TechCrunch that this number represents "all-time users."

That means 5 million people have tried out GitHub Copilot for the first time in the last three months — the company reported in April [the tool had reached 15 million users](#). Microsoft and GitHub don't report how many of these 20 million people have continued to use the AI coding tool on a monthly or daily basis — though those metrics are likely far lower.

Microsoft also reported that GitHub Copilot, which is among the most popular AI coding tools offered today, is used by 90% of the Fortune 100. The product's growth among enterprise customers has also grown about 75% compared to last quarter, according to the company.

AI coding tools are rising in popularity, and they seem to be one of the few AI products generating notable revenue. In 2024, Nadella said [GitHub Copilot was a larger business](#) than all of GitHub was when Microsoft acquired it in 2018. In the year since, it seems GitHub Copilot's growth rate has continued in a positive direction.

The world's most popular AI coding tools still have tiny user bases compared to AI chatbots like ChatGPT and Gemini, which attract hundreds of millions of users every month. Of course, software engineering is more niche than the general informational queries offered by AI chatbots.

That said, software engineers and their employers seem to be willing to pay a premium for AI coding tools. And with Microsoft's long list of enterprise customers and GitHub's ecosystem of developers, GitHub Copilot is well positioned to dominate the market for enterprise AI coding tools.

Cursor, another popular AI coding tool, wants to challenge GitHub Copilot in the enterprise, and it's been [scooping up talent](#) from fledgling AI startups to do so. Cursor reportedly had [more than a million people](#) using its product every day in March, according to Bloomberg. At that time, the company generated about \$200 million in annualized recurring revenue. Today, [Cursor's ARR is more than \\$500 million](#), suggesting there are now a lot more people using its products every day.

While GitHub Copilot and Cursor initially sought to tackle different parts of the developer experience, they're steadily converging into similar products.

Both companies have recently introduced [AI agents to review code](#) and [catch bugs](#) introduced by humans. GitHub and Cursor are also trying to create [AI agents that automate programmer workflows](#), allowing developers to offload tasks altogether. Nadella said during Wednesday's earnings call that GitHub was seeing great momentum with their AI coding agents.

Beyond Cursor, GitHub has an array of well-capitalized competitors that would like to sell AI coding tools to the enterprise.

There's Google — which [acquired the leaders of AI coding startup Windsurf](#) — as well as Cognition, the maker of Devin that [subsequently acquired the rest of Windsurf's team](#). And there's OpenAI and Anthropic, which are both building out their own AI coding offerings powered by in-house AI models, Codex and Claude Code, respectively, in an attempt to win the market.

The nascent space is quickly heating up into one of AI's most competitive markets.

Google's AI coding agent Jules is now out of beta

Jagmeet Singh — 9:00 AM PDT · August 6, 2025

Google on Wednesday launched its AI coding agent, Jules, out of beta, just over two months after its [public preview debut in May](#).

IMAGE CREDITS: JAGMEET SINGH / TECHCRUNCH

Powered by Gemini 2.5 Pro, Jules is an asynchronous, agent-based coding tool that integrates with GitHub, clones codebases into Google Cloud virtual machines, and uses AI to fix or update code while developers focus on other tasks.

Google [initially announced](#) Jules as a Google Labs project in December and made it [available to beta testers](#) through a public preview at its I/O developer conference.

Kathy Korevec, director of product at Google Labs, told TechCrunch that the tool's improved stability drove the decision to take it out of beta after receiving hundreds of UI and quality updates during its beta phase.

"The trajectory of where we're going gives us a lot of confidence that Jules is around and going to be around for the long haul," she said.

With the wider rollout, Google introduced structured pricing tiers for Jules, starting with an "introductory access" free plan capped at 15 individual daily tasks and three concurrent ones, down from the 60-task limit during beta. Jules' paid tiers are part of the Google AI Pro and Ultra plans, which are priced at \$19.99 and \$124.99 a month, and offer subscribers 5x and 20x higher limits, respectively.

Korevec noted that Jules' packaging and pricing are based on "real usage" insights gathered over the past couple of months.

"The 60-task cap helped us study how developers use Jules and gave us the information we needed to design the new packaging," she said. "The

15/day is designed to give people a sense of whether Jules will work for them on real project tasks.”

Google also updated Jules’ privacy policy to be more explicit about how it trains AI. If a repository is public, its data may be used for training, but if it is private, Korevec said that no data is sent.

“We got a little bit of feedback from users that it [the privacy policy] wasn’t as clear as we thought it was, and so most of it is just responding to that. We didn’t change anything about what we’re doing on the training side, but we changed the language,” Korevec said.

During the beta, Google said that thousands of developers tackled tens of thousands of tasks, resulting in over 140,000 code improvements shared publicly. Initial feedback led the Google Labs team to add new capabilities, including reusing previous setups for faster task execution, integrating with GitHub issues, and supporting multimodal input.

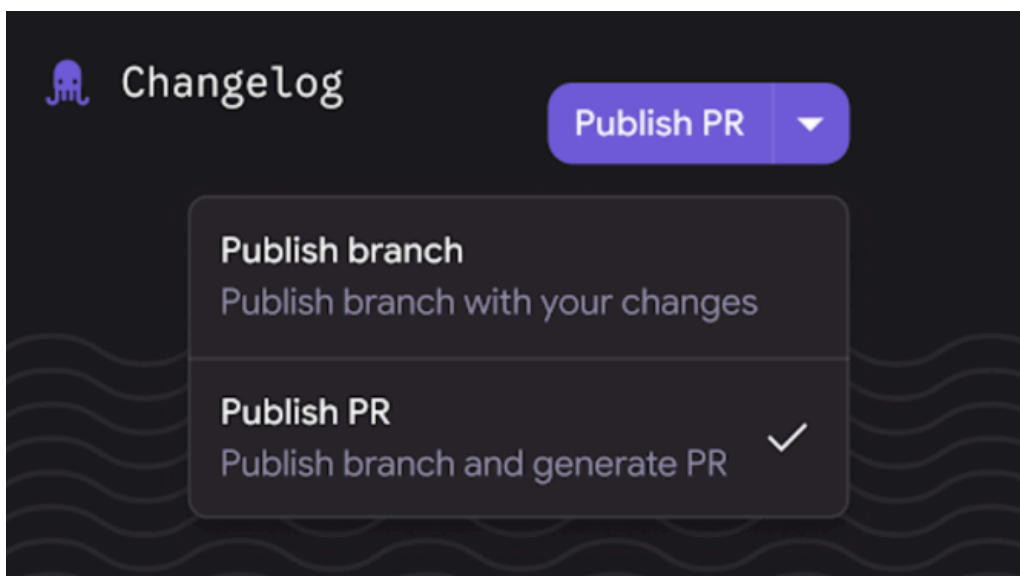

IMAGE CREDITS: JULES / X

The two primary users of Jules so far are the AI enthusiasts and professional developers, Korevec said.

By running asynchronously in a virtual machine, Jules stands apart from top AI coding tools like Cursor, Windsurf, and Lovable, which all work synchronously and require users to watch the output after each prompt.

“Jules operates like an extra set of hands ... you can basically kick off tasks to it, and then you could close your computer and walk away from it if you want and then come back hours later. Jules would have those tasks done for you, versus if you were doing that with a local agent or using a synchronous agent, you would be bound to that session,” Korevec explained.

This week, Jules received a deeper integration with GitHub to [open pull requests automatically](#) — just like it could open branches — and a feature called [Environment Snapshots](#) to save dependencies and install scripts as a snapshot for faster, more consistent task execution.

From vibe coding to mobile use, beta trials informed Jules’ development

Since entering public beta, Jules has logged 2.28 million visits worldwide, 45% of them from mobile devices, per data from market intelligence provider [SimilarWeb](#), reviewed by TechCrunch. India was the top market for traffic, followed by the U.S. and Vietnam.

Google did not share specifics on Jules’ user base and its top geographies.

Korevec told TechCrunch that during the beta, the team observed that many people used Jules from traditional vibe-coding tools to either fix bugs that might have been implemented or extend the vibe-coded project to make it more production-ready.

Originally, Jules required users to have an existing codebase. But Google soon realized many potential users — like those trying other AI tools — might want to explore it without one. Korevec said the company quickly enabled Jules to work even with an empty repository. That helped increase its scope and usage.

Google Labs’ team also noticed an increasing number of users accessing Jules through their mobile devices. Although the tool does not have a dedicated mobile app, Korevec said users were accessing it through its web app.

“Since it’s a big use case that we’re seeing emerging, we’re absolutely exploring what the features are that people need on mobile a lot more,” she noted.

Alongside beta testers, Korevec stated that Google already uses Jules to help develop some projects internally, and there is now a “big push” to use the tool on “a lot more projects” at the company.

Microsoft brings OpenAI's smallest open model to Windows users

Ram Iyer — 5:47 AM PDT · August 6, 2025

Microsoft is making OpenAI's new free and open GPT model, [gpt-oss-20b](#), available to Windows 11 users via [Windows AI Foundry](#), the tech giant's platform that lets users tap AI features, APIs, and popular open source models on their computers.

OpenAI's GPT-5 is here

Maxwell Zeff — 10:00 AM PDT · August 7, 2025

GPT-5 Flagship model

OpenAI has launched GPT-5, a new flagship AI model that will power the company's next generation of ChatGPT.

GPT-5, which was released Thursday, is OpenAI's first "unified" AI model and combines the reasoning abilities of its [o-series](#) of models with the fast responses of its [GPT series](#). The next-generation model signals a new era for ChatGPT — and its creator, OpenAI — pointing to OpenAI's broader ambitions to develop AI systems that are [more like agents](#) than chatbots.

IMAGE CREDITS: OPENAI

While [GPT-4](#) enabled AI chatbots to offer smart responses on a wide variety of questions, GPT-5 allows ChatGPT to complete a wide variety of tasks on behalf of users — such as generating software applications, navigating a user's calendar, or creating research briefs.

With GPT-5, OpenAI has also sought to make ChatGPT simpler to use. Instead of asking users to choose the right settings, GPT-5 comes equipped with a real-time router that decides how to offer the best answer, whether that's responding to user questions quickly or taking additional time to "think" through answers.

During a briefing with reporters, OpenAI CEO Sam Altman claimed GPT-5 is “the best model in the world,” and said it represented a “significant step” along the company’s path to developing AI that can outperform humans at most economically valuable work — that is, artificial general intelligence (AGI).

“Having something like GPT-5 would be pretty much unimaginable at any previous time in history,” said Altman.

Starting Thursday, GPT-5 will be available to all free users of ChatGPT as their default model. OpenAI’s VP of ChatGPT, Nick Turley, said this is part of the company’s effort to give free users access to an AI reasoning model for the first time. (Previously, the company gated these more advanced models behind a paywall.)

“This is just one of the ways that I’m excited to live the mission, making sure that this stuff actually benefits people,” said Turley on the decision, referencing OpenAI’s long-standing [mission](#) to distribute advanced AI to as many people as possible.

The expectations are high for GPT-5, one of OpenAI’s most anticipated product launches since ChatGPT put the company on the map in 2022.

Since then, ChatGPT has grown into one of the world’s most popular consumer products, reaching more than 700 million users every week — nearly 10% of the globe’s population, according to the company.

Many see GPT-5 as a bellwether for AI progress broadly, and the model’s reception by Silicon Valley could have profound implications for Big Tech, Wall Street, and policymakers regulating technology. These stakeholders are watching to see if GPT-5 offers a significant jump in AI’s capabilities, much like its predecessor, GPT-4, which challenged expectations of what software can do.

GPT-5 offers a slight edge on the competition

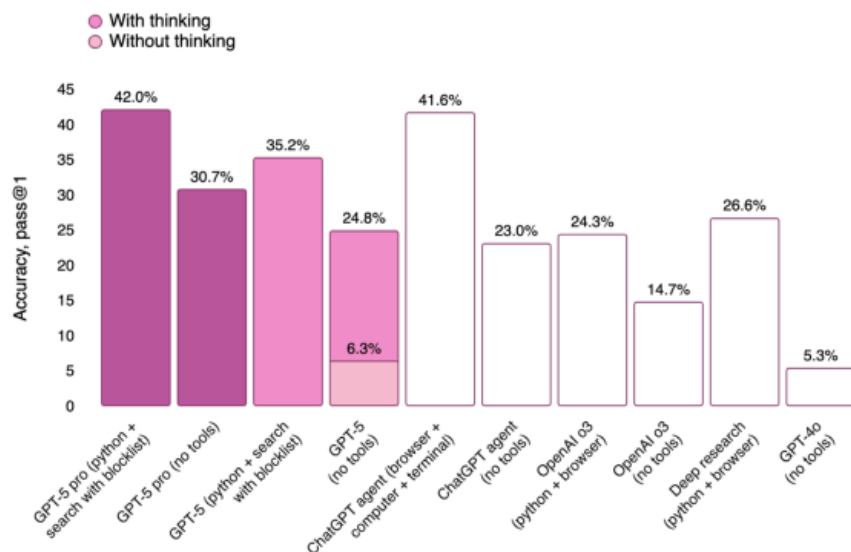

OpenAI claims GPT-5 is state-of-the-art in several domains, slightly edging out leading AI models from Anthropic, Google DeepMind, and Elon Musk’s xAI on key benchmarks. However, GPT-5 slightly underperforms frontier AI models in other areas.

The company says GPT-5 offers frontier-level performance around coding; Altman said the model specifically excels at spinning up entire software applications on demand, in what’s become known as “vibe coding.”

On SWE-bench Verified — a test of real-world coding tasks pulled from GitHub — GPT-5 scores 74.9% on its first attempt. That means GPT-5 just outperforms Anthropic’s latest Claude Opus 4.1 model, which scored [74.5%](#), and Google DeepMind’s Gemini 2.5 Pro, which scored [59.6%](#).

On Humanity’s Last Exam — a difficult test measuring AI model performance across math, humanities, and the natural sciences — a version of GPT-5 with extended reasoning (GPT-5 Pro) scored 42% when using tools. That’s slightly less than xAI was able to achieve with [Grok 4 Heavy](#), which scored 44.4% on the test.

Humanity’s Last Exam (Full Set)*
Expert-level questions across subjects

On GPQA Diamond — a test of PhD-level science questions — GPT-5 pro scored 89.4% on its first try, outperforming Claude Opus 4.1, which scored 80.9%, and Grok 4 Heavy, which scored 88.9%.

OpenAI says GPT-5 is better for answering health-related questions. On a test measuring accuracy in AI model responses around healthcare topics, HealthBench Hard Hallucinations, OpenAI says GPT-5 (with thinking) hallucinates just 1.6% of the time. This is far lower than the company's previous GPT-4o and o3 models, which scored 12.9% and 15.8, respectively.

While AI chatbots are not medical professionals, [millions of people](#) are using them for health advice. In response to this phenomenon, the company says GPT-5 is more proactive about flagging potential health concerns and helping users parse medical results.

In addition, OpenAI says GPT-5 is better than other AI models on more difficult-to-measure, [subjective domains](#), such as creative design and writing. Turley said GPT-5 responds more naturally and exhibits “better taste” than other AI models on creative tasks.

“The vibes of this model are really good,” said Turley.

GPT-5 is also more accurate than OpenAI's previous models, and the company says it suffers far less from hallucinations — the tendency for AI models to make up information — compared to its o-series models. Hallucinations seemed to be [getting worse](#) in OpenAI's latest AI reasoning models, such as o3, and OpenAI previously said it didn't quite understand why it was happening.

In responses to ChatGPT prompts, OpenAI found that GPT-5 (with thinking) hallucinates and responds with incorrect information 4.8% of the time. That's a significant reduction from o3 and GPT-4o, which score hallucination rates of 22% and 20.6%, respectively, on the test.

On a benchmark measuring an AI model's agentic ability to complete simulated online tasks, Tau-bench, GPT-5 offers mixed performance. On part of the test measuring an AI's ability to navigate an airline's website, GPT-5 scores 63.5%, slightly underperforming o3, which scored 64.8%. On another part of the test measuring AI's ability to navigate retail websites, GPT-5 scores 81.1%, underperforming Claude Opus 4.1, which scored 82.4%.

OpenAI also says that GPT-5 is safer than its previous models. While AI reasoning models occasionally exhibit a tendency to [scheme against humans](#) or lie to promote their own goals, OpenAI found that GPT-5 was deceptive at a lower rate than other models.

Alex Beutel, OpenAI's safety research lead, said reducing deception improves not only the safety of GPT-5, but also the user experience,

creating a model that’s more “transparent and honest in ways users can trust.”

Beutel also notes GPT-5 is better at discerning between bad actors who are trying to misuse ChatGPT and users making harmless requests. This results in GPT-5 being able to refuse more unsafe questions, while offering fewer rejections to users seeking harmless information.

Upgrades for consumers and developers

ChatGPT is getting a few user experience upgrades as part of the GPT-5 launch. Users can now select from four new personalities in ChatGPT’s setting: Cynic, Robot, Listener, and Nerd. The company says these will adapt ChatGPT’s responses without requiring users to specifically ask the model to respond in a certain way.

Subscribers to ChatGPT’s \$20-per-month Plus plan get higher usage limits for GPT-5 than free users. Meanwhile, \$200-per-month Pro subscribers will have unlimited access to GPT-5, as well as a souped-up version called GPT-5 Pro that uses additional computational resources to produce better answers. Organizations on OpenAI’s Team, Edu, and Enterprise plans will gain access to GPT-5 as their default model next week.

For developers, GPT-5 is coming to OpenAI’s API in three sizes — gpt-5, gpt-5-mini, and gpt-5-nano — which will spend more or less time “reasoning” through tasks. Developers can also now control verbosity in the OpenAI API, deciding how long or short an AI model’s responses should be.

The base model of GPT-5 will cost developers \$1.25 per million input tokens (roughly 750,000 words, longer than the entire “Lord of the Rings” series) and \$10 per million output tokens.

The launch of GPT-5 comes after a busy week for OpenAI. The company released an open-weight reasoning model, [gpt-oss](#), that developers and enterprises can download for free and run at a fraction of the cost. The open model nearly matched the abilities of OpenAI’s previous top models, o3 and o4-mini, but GPT-5 sets a new standard for frontier performance in some areas, such as coding.

However, GPT-5 seems to be roughly on par with other frontier AI models in several areas. Benchmarks, of course, only tell part of the story for any AI model, and it remains to be seen how developers will use GPT-5 in the real world, and whether the model is truly a step above the competition.
