Google is experimenting  
with machine learning-  
powered age-estimation  
tech in the US

Google is testing a machine learning-powered tech in the U.S. to determine the age of users and filter content across all its products accordingly.

The company said it will consider data from Google accounts, including types of details users have searched for or categories of videos they have watched on YouTube, to determine the age. If the company's tool decides that a user is under 18, they would get an email with details about how Google products might change for them.

For these users, Google will disable the timeline in Maps, stop personalized ads, restrict age-restricted ad categories, and bar them from accessing adult-themed apps on the Play Store. The company will also turn on [digital well-being features](#) on YouTube, such as break reminders and "go to bed" notifications when consuming videos late at night. Plus, it will prevent underage users from accessing certain kinds of content — [such as content that could trigger body image issues](#) — repeatedly.

If users think they have been tagged as an underage account by mistake, they can appeal the decision and prove their age using a photo of their government ID or a selfie.

Google rolled out [similar measures for YouTube earlier this week](#), and now the company is experimenting with machine learning-based age

## The Browser Company launches a \$20 monthly subscription for its AI-powered browser

Ivan Mehta — 11:26 PM PDT · August 6, 2025

The [Browser Company](#) has launched a Pro subscription plan for Dia, its new web browser that heavily integrates AI features. The plan costs \$20 per month and provides unlimited access to Dia's AI-powered chat and skills features.

The introduction of a paid tier means free users will now face usage limits on AI features. While The Browser Company hasn't specified exact limits, CEO Josh Miller told [The New York Times](#) in July that the browser will remain free for those who use AI features "a few times a week."

Advertisement

IMAGE CREDITS:SCREENSHOT BY TECHCRUNCH

Miller also indicated that the startup plans to offer multiple subscription tiers, ranging from \$5 per month to hundreds of dollars monthly. The current \$20 plan appears to be one of several options based on different feature sets.

Earlier this week, users on [Reddit](#) and [Threads](#) noticed that The Browser Company had quietly made the Pro plan available online. However, the company quickly removed the page. Now the subscription option has been restored and can be accessed through Dia’s settings page.

# OpenAI's GPT-5 is here

Maxwell Zeff — 10:00 AM PDT · August 7, 2025

## GPT-5 flagship model

OpenAI has launched GPT-5, a new flagship AI model that will power the company's next generation of ChatGPT.

IMAGE CREDITS: OPENAI

GPT-5, which was released Thursday, is OpenAI's first "unified" AI model and combines the reasoning abilities of its [o-series](#) of models with the fast responses of its [GPT series](#). The next-generation model signals a new era for ChatGPT — and its creator, OpenAI — pointing to OpenAI's broader ambitions to develop AI systems that are [more like agents](#) than chatbots.

While [GPT-4](#) enabled AI chatbots to offer smart responses on a wide variety of questions, GPT-5 allows ChatGPT to complete a wide variety of tasks on behalf of users — such as generating software applications, navigating a user's calendar, or creating research briefs.

With GPT-5, OpenAI has also sought to make ChatGPT simpler to use. Instead of asking users to

choose the right settings, GPT-5 comes equipped with a real-time router that decides how to offer the best answer, whether that’s responding to user questions quickly or taking additional time to “think” through answers.

IMAGE CREDITS:OPENAI

During a briefing with reporters, OpenAI CEO Sam Altman claimed GPT-5 is “the best model in the world,” and said it represented a “significant step” along the company’s path to developing AI that can outperform humans at most economically valuable work — that is, artificial general intelligence (AGI).

“Having something like GPT-5 would be pretty much unimaginable at any previous time in history,” said Altman.

Starting Thursday, GPT-5 will be available to all free users of ChatGPT as their default model. OpenAI’s VP of ChatGPT, Nick Turley, said this is part of the company’s effort to give free users access to an AI reasoning model for the first time. (Previously, the company gated these more advanced models behind a paywall.)

“This is just one of the ways that I’m excited to live the mission, making sure that this stuff actually benefits people,” said Turley on the decision, referencing OpenAI’s long-standing [mission](#) to distribute advanced AI to as many people as possible.

The expectations are high for GPT-5, one of OpenAI's most anticipated product launches since ChatGPT put the company on the map in 2022. Since then, ChatGPT has grown into one of the world's most popular consumer products, reaching more than 700 million users every week — nearly 10% of the globe's population, according to the company.

Many see GPT-5 as a bellwether for AI progress broadly, and the model's reception by Silicon Valley could have profound implications for Big Tech, Wall Street, and policymakers regulating technology. These stakeholders are watching to see if GPT-5 offers a significant jump in AI's capabilities, much like its predecessor, GPT-4, which challenged expectations of what software can do.

## GPT-5 offers a slight edge on the competition

OpenAI claims GPT-5 is state-of-the-art in several domains, slightly edging out leading AI models from Anthropic, Google DeepMind, and Elon Musk's xAI on key benchmarks. However, GPT-5 slightly underperforms frontier AI models in other areas.

The company says GPT-5 offers frontier-level performance around coding; Altman said the model specifically excels at spinning up entire software applications on demand, in what's become known as "vibe coding."

On SWE-bench Verified — a test of real-world coding tasks pulled from GitHub — GPT-5 scores 74.9% on its first attempt. That means GPT-5 just outperforms Anthropic's latest Claude Opus 4.1 model, which scored [74.5%](#), and Google DeepMind's Gemini 2.5 Pro, which scored [59.6%](#).

On Humanity's Last Exam — a difficult test measuring AI model performance across math, humanities, and the natural sciences — a version of GPT-5 with extended reasoning (GPT-5 Pro) scored 42% when using tools. That's slightly less than xAI was able to achieve with [Grok 4 Heavy](#), which scored 44.4% on the test.

- Events
- Podcasts
- Newsletters

time. This is far lower than the company’s previous GPT-4o and o3 models, which scored 12.9% and 15.8, respectively.

While AI chatbots are not medical professionals, [millions of people](#) are using them for health advice. In response to this phenomenon, the company says GPT-5 is more proactive about flagging potential health concerns and helping users parse medical results.

In addition, OpenAI says GPT-5 is better than other AI models on more difficult-to-measure, [subjective domains](#), such as creative design and writing. Turley said GPT-5 responds more naturally and exhibits “better taste” than other AI models on creative tasks.

“The vibes of this model are really good,” said Turley.

GPT-5 is also more accurate than OpenAI’s previous models, and the company says it suffers far less from hallucinations — the tendency for AI models to make up information — compared to its o-series models. Hallucinations seemed to be [getting worse](#) in OpenAI’s latest AI reasoning models, such as o3, and OpenAI previously said it didn’t quite understand why it was happening.

In responses to ChatGPT prompts, OpenAI found that GPT-5 (with thinking) hallucinates and responds with incorrect information 4.8% of the time. That’s a significant reduction from o3 and GPT-4o, which score hallucination rates of 22% and 20.6%, respectively, on the test.

On a benchmark measuring an AI model’s agentic ability to complete simulated online tasks, Tau-bench, GPT-5 offers mixed performance. On part of the test measuring an AI’s ability to navigate an airline’s website, GPT-5 scores 63.5%, slightly underperforming o3, which scored 64.8%. On another part of the test measuring AI’s ability to navigate retail websites, GPT-5 scores 81.1%, underperforming Claude Opus 4.1, which scored 82.4%.

OpenAI also says that GPT-5 is safer than its previous models. While AI reasoning models occasionally exhibit a tendency to [scheme against humans](#) or lie to promote their own goals, OpenAI found that GPT-5 was deceptive at a lower rate than other models.

Alex Beutel, OpenAI’s safety research lead, said reducing deception improves not only the safety of GPT-5, but also the user experience, creating a model that’s more “transparent and honest in ways users can trust.”

Beutel also notes GPT-5 is better at discerning between bad actors who are trying to misuse ChatGPT and users making harmless requests. This results in GPT-5 being able to refuse more unsafe questions, while offering fewer rejections to users seeking harmless information.

## Upgrades for consumers and developers

ChatGPT is getting a few user experience upgrades as part of the GPT-5 launch. Users can now select from four new personalities in ChatGPT's setting: Cynic, Robot, Listener, and Nerd. The company says these will adapt ChatGPT's responses without requiring users to specifically ask the model to respond in a certain way.

Subscribers to ChatGPT's \$20-per-month Plus plan get higher usage limits for GPT-5 than free users. Meanwhile, \$200-per-month Pro subscribers will have unlimited access to GPT-5, as well as a souped-up version called GPT-5 Pro that uses additional computational resources to produce better answers. Organizations on OpenAI's Team, Edu, and Enterprise plans will gain access to GPT-5 as their default model next week.

For developers, GPT-5 is coming to OpenAI's API in three sizes — gpt-5, gpt-5-mini, and gpt-5-nano — which will spend more or less time “reasoning” through tasks. Developers can also now control verbosity in the OpenAI API, deciding how long or short an AI model's responses should be.

The base model of GPT-5 will cost developers \$1.25 per million input tokens (roughly 750,000 words, longer than the entire “Lord of the Rings” series) and \$10 per million output tokens.

The launch of GPT-5 comes after a busy week for OpenAI. The company released an open-weight reasoning model, [gpt-oss](#), that developers and enterprises can download for free and run at a fraction of the cost. The open model nearly matched the abilities of OpenAI's previous top models, o3 and o4-mini, but GPT-5 sets a new standard for frontier performance in some areas, such as coding.

However, GPT-5 seems to be roughly on par with other frontier AI models in several areas. Benchmarks, of course, only tell part of the story for any AI model, and it remains to be seen how developers will use GPT-5 in the real world, and whether the model is truly a step above the competition.

# Google denies AI search features are killing website traffic

Sarah Perez — 12:45 PM PDT · August 6, 2025

Numerous studies indicate that the [shift to AI search features](#) and the use of [AI chatbots](#) are killing traffic to publishers' sites. But Google on Wednesday denied that's the case, at least in aggregate. Instead, the search giant says that total organic click volume from its search engine to websites has been "relatively stable" year-over-year and that average click quality has slightly increased.

"This data is in contrast to third-party reports that inaccurately suggest dramatic declines in aggregate traffic — often based on flawed methodologies, isolated examples, or traffic changes that occurred prior to the roll out of AI features in Search," writes Google VP and Head of Search, Liz Reid, in [a new blog post](#).

Though Google hasn't shared any specific data to back up its conclusions, even if we assume

Google’s claims to be true, this doesn’t necessarily mean that AI isn’t having an impact.

Even Google has to admit this, as Reid acknowledges that “user trends are shifting traffic to different sites, resulting in decreased traffic to some sites and increased traffic to others.”

That word “some” is doing heavy lifting here, as Google doesn’t share data about how many sites are gaining or losing. And while chatbots like ChatGPT have certainly seen traffic increase in recent months, that doesn’t mean online publishers aren’t suffering.

IMAGE CREDITS :GOOGLE

Google has been revamping its search engine for years to answer more questions directly on the search results page, and now does so with AI through its “AI Overviews” that appear at the top of search results. Google also allows users to interact with an AI chatbot for some queries. Yet Google denies that this is significantly reshaping the search landscape. Rather, it points to users shifting their attention to other sites to start their queries.

Reid explains, “People are increasingly seeking out and clicking on sites with forums, videos, podcasts, and posts where they can hear authentic voices and first-hand perspectives.”

Reading between the lines, it seems like Google.com isn’t necessarily people’s first stop on

- Instagram takes on Snapchat with new ‘Instagram Map’
- Google says hackers stole its customers’ data by breaching its Salesforce database
- Three weeks after acquiring Windsurf, Cognition offers staff the exit door
- Spotify raises subscription prices
- The uproar over Vogue’s AI-generated ad isn’t just about fashion
- Your public ChatGPT queries are getting indexed by Google and other search engines

the web these days. (Google denies this, telling us that Reid’s commentary is only reflective of trends it’s seeing in traffic to sites from Google.)

However, we’ve seen this trend for some time. Back in 2022, a Google exec even said that social sites like TikTok and Instagram [were eating into Google’s core products](#), like Search and Maps.

“In our studies, something like almost 40% of young people, when they’re looking for a place for lunch, they don’t go to Google Maps or Search,” said Google SVP Prabhakar Raghavan, who ran the company’s Knowledge and Information organization at the time (he is now its chief technologist). “They go to TikTok or Instagram,” he noted.

Google has also long been worried that Amazon.com had become people’s first stop for online shopping searches, and Reddit.com had become the first stop for researching topics of interest.

Over many years, the company has tried to come up with compelling features for both consumers and retailers that would attract more users to Google Shopping. These efforts have included [universal shopping carts](#), [local inventory checks](#), [deal finders](#), [shopping from product images on websites](#), and more. It even [made its Shopping listings free](#) for merchants in 2020.

Meanwhile, as users [complained that Google Search quality was declining](#), the search giant was seeing so much demand for Reddit that it finally [added a “Reddit” filter](#) to allow users to narrow down results on relevant search queries. (Now that filter simply reads “forums.”)

So perhaps there’s some truth in Google’s denials — it’s not AI that’s entirely responsible for killing

search. Search was already dying.

IMAGE CREDITS: SMITH COLLECTION/GADO / GETTY IMAGES

Google’s new blog post also attempts to move the goalposts a bit about what it means for websites receiving Google’s clicks. Now, instead of counting clicks, it wants publishers to think about click quality.

The company says average click quality has increased, and Google is sending “slightly more quality clicks” to websites than a year ago. (Google explains that a quality click is one where users don’t quickly click back — they stay and read.) How much of an increase, though, Google doesn’t say. The company only points out that when people click through on an AI response to the source, they’re more likely to dive deeper, so those clicks are more valuable.

What’s more, Google paints AI as an opportunity for web publishers to gain increased exposure, saying that “with AI Overviews, people are seeing more links on the page than before,” Reid writes. “More queries and more links mean more opportunities for websites to surface and get clicked.”

But AI, [while a growing referral source](#), isn’t [yet making up the difference](#) in terms of clicks, reports have shown. One recent study from Similarweb

indicates that the number of news searches on the web resulting in zero clicks to news websites has grown from 56% (when Google launched AI Overviews in May 2024) to 69% as of May 2025.

IMAGE CREDITS:SIMILARWEB

Google appears to know this is a trend, too, as it recently launched [a product for publishers](#) that helps them monetize their dwindling traffic in other ways that don't rely only on advertising, like micropayments or newsletter sign-ups.

The fact that Google is pushing this “AI is not the end of search traffic!” PR now only makes the situation seem more dire. It's as if Google wants publishers to believe not what their own eyes — and graphs and charts — tell them, but instead take comfort in the fact that Google still sends “billions of clicks to websites” every day, just as the post claims.

*Updated after publication with a comment from Google.*
