Google's AI coding agent
Jules is now out of beta

Google on Wednesday launched its AI coding agent, Jules, out of beta, just over two months after its [public preview debut in May](#).

Powered by Gemini 2.5 Pro, Jules is an asynchronous, agent-based coding tool that integrates with GitHub, clones codebases into Google Cloud virtual machines, and uses AI to fix or update code while developers focus on other tasks.

Google [initially announced](#) Jules as a Google Labs project in December and made it [available to beta testers](#) through a public preview at its I/O developer conference.

IMAGE CREDITS: JAGMEET SINGH / TECHCRUNCH

Kathy Korevec, director of product at Google Labs, told TechCrunch that the tool's improved stability drove the decision to take it out of beta after receiving hundreds of UI and quality updates during its beta phase.

"The trajectory of where we're going gives us a lot of confidence that Jules is around and going to be around for the long haul," she said.

With the wider rollout, Google introduced structured pricing tiers for Jules, starting with an "introductory access" free plan capped at 15 individual daily tasks and three concurrent ones, down from the 60-task limit during beta. Jules' paid tiers are part of the Google AI Pro and Ultra plans, which are priced at \$19.99 and \$124.99 a month, and offer subscribers 5x and 20x higher limits, respectively.

[Book Your Table >](#)

Most Popular

- Key sections of the US Constitution deleted from government's website
- Three weeks after acquiring Windsurf, Cognition offers staff the exit door
- Roku launches Howdy, a \$2.99 ad-free streaming service
- Spotify raises subscription prices
- The uproar over Vogue's AI-generated ad isn't just about fashion

Korevec noted that Jules’ packaging and pricing are based on “real usage” insights gathered over the past couple of months.

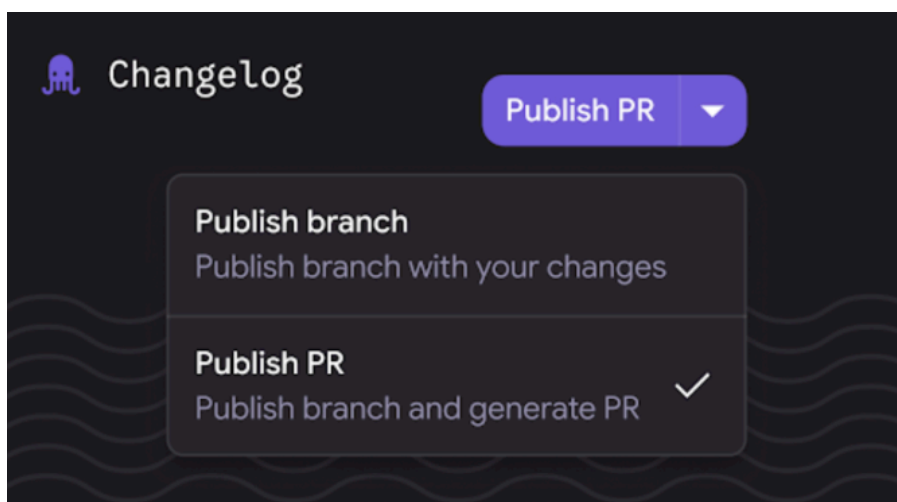

“The 60-task cap helped us study how developers use Jules and gave us the information we needed to design the new packaging,” she said. “The 15/day is designed to give people a sense of whether Jules will work for them on real project tasks.”

Google also updated Jules’ privacy policy to be more explicit about how it trains AI. If a repository is public, its data may be used for training, but if it is private, Korevec said that no data is sent.

“We got a little bit of feedback from users that it [the privacy policy] wasn’t as clear as we thought it was, and so most of it is just responding to that. We didn’t change anything about what we’re doing on the training side, but we changed the language,” Korevec said.

During the beta, Google said that thousands of developers tackled tens of thousands of tasks, resulting in over 140,000 code improvements shared publicly. Initial feedback led the Google Labs team to add new capabilities, including reusing previous setups for faster task execution, integrating with GitHub issues, and supporting multimodal input.

- Lina Khan points to Figma IPO as vindication of M&A scrutiny
- Your public ChatGPT queries are getting indexed by Google and other search engines

The two primary users of Jules so far are the AI enthusiasts and professional developers, Korevec said.

By running asynchronously in a virtual machine, Jules stands apart from top AI coding tools like Cursor, Windsurf, and Lovable, which all work synchronously and require users to watch the output after each prompt.

“Jules operates like an extra set of hands ... you can basically kick off tasks to it, and then you could close your computer and walk away from it if you want and then come back hours later. Jules would have those tasks done for you, versus if you were doing that with a local agent or using a synchronous agent, you would be bound to that session,” Korevec explained.

This week, Jules received a deeper integration with GitHub to [open pull requests automatically](#) — just like it could open branches — and a feature called [Environment Snapshots](#) to save dependencies and install scripts as a snapshot for faster, more consistent task execution.

From vibe coding to mobile use, beta trials informed Jules’ development

Since entering public beta, Jules has logged 2.28 million visits worldwide, 45% of them from mobile devices, per data from market intelligence provider [SimilarWeb](#), reviewed by TechCrunch. India was the top market for traffic, followed by the U.S. and Vietnam.

Google did not share specifics on Jules’ user base and its top geographies.

Korevec told TechCrunch that during the beta, the team observed that many people used Jules from traditional vibe-coding tools to either fix bugs that might have been implemented or extend the vibe-coded project to make it more production-ready.

Originally, Jules required users to have an existing codebase. But Google soon realized many potential users — like those trying other AI tools — might want to explore it without one. Korevec said the company quickly enabled Jules to work even with an empty repository. That helped increase its scope and usage.

Google Labs’ team also noticed an increasing number of users accessing Jules through their mobile devices. Although the tool does not have a dedicated mobile app, Korevec said users were accessing it through its web app.

“Since it’s a big use case that we’re seeing emerging, we’re absolutely exploring what the features are that people need on mobile a lot more,” she noted.

Alongside beta testers, Korevec stated that Google already uses Jules to help develop some projects internally, and there is now a “big push” to use the tool on “a lot more projects” at the company.

Stitch is Google's AI-powered tool to help design apps

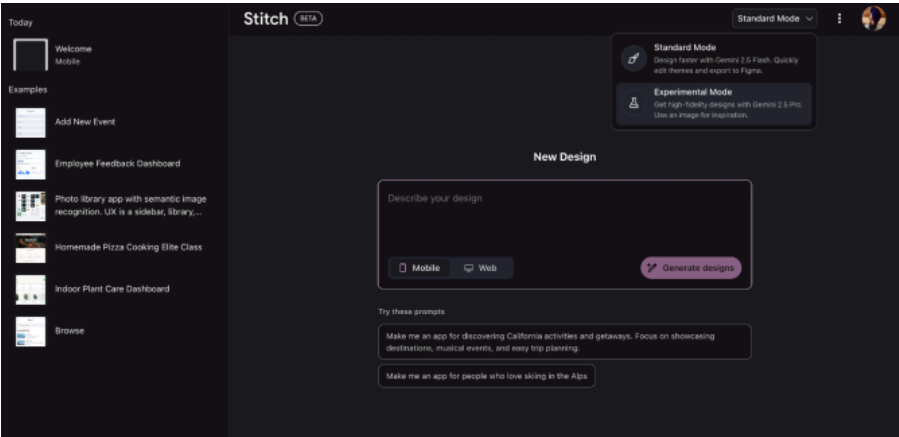

Jagmeet Singh — 10:45 AM PDT · May 20, 2025

At the [Google I/O 2025 developer conference](#), Google launched [Stitch](#), an AI-powered tool to help design web and mobile app front ends by generating the necessary UI elements and code.

Stitch can be prompted to create app UIs with a few words or even an image, providing HTML and CSS

Advertisement

markup for the designs it generates. Users can choose between Google’s Gemini 2.5 Pro and Gemini 2.5 Flash AI models to power Stitch’s code and interface ideation.

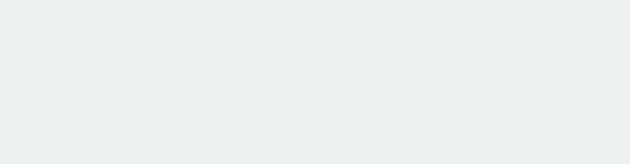

STITCH LETS USERS CHOOSE BETWEEN GEMINI 2.5 FLASH AND GEMINI 2.5 PRO MODELS

IMAGE CREDITS:JAGMEET SINGH / TECHCRUNCH

Stitch arrives as so-called vibe coding — programming using code-generating AI models — continues to grow in popularity. There are a number of large tech startups going after the burgeoning market, including [Cursor](#) maker Anyosphere, [Cognition](#), and [Windsurf](#). Just last week, OpenAI launched a new assistive coding service called [Codex](#). And yesterday during its Build 2025 kickoff, Microsoft rolled out a series of updates to its GitHub Copilot coding assistant.

Stitch is a bit more limited in what it can do compared to some other vibe coding products, but there are a fair amount of customization options. The tool supports directly exporting to Figma and can expose code so that it can be refined and worked on in an IDE. Stitch also lets users fine-tune any of the app design elements it generates.

In a demo with TechCrunch, Google product manager Kathy Korevec showed two projects created using Stitch: a responsive mobile UI design for an app for bookworms and a web dashboard for beekeeping.

“[Stitch is] where you can come and get your initial iteration done, and then you can keep going from there,” said Korevec. “What we want to do is make it super, super easy and approachable for people to do that next level of design thinking or that next level of software building for them.”

Soon after I/O, Google plans to add a feature that'll allow users to make changes in their UI designs by taking screenshots of the object they want to tweak and annotating it with the modifications they want, Korevec said. She added that while Stitch is reasonably powerful, it isn't meant to be a full-fledged design platform like Figma or Adobe XD.

Alongside Stitch, Google has expanded access to [Jules](#), its AI agent aimed at helping developers fix bugs in their code. Now in [public beta](#), the tool helps developers understand complex code, create pull requests on GitHub, and handle certain backlog items and programming tasks.

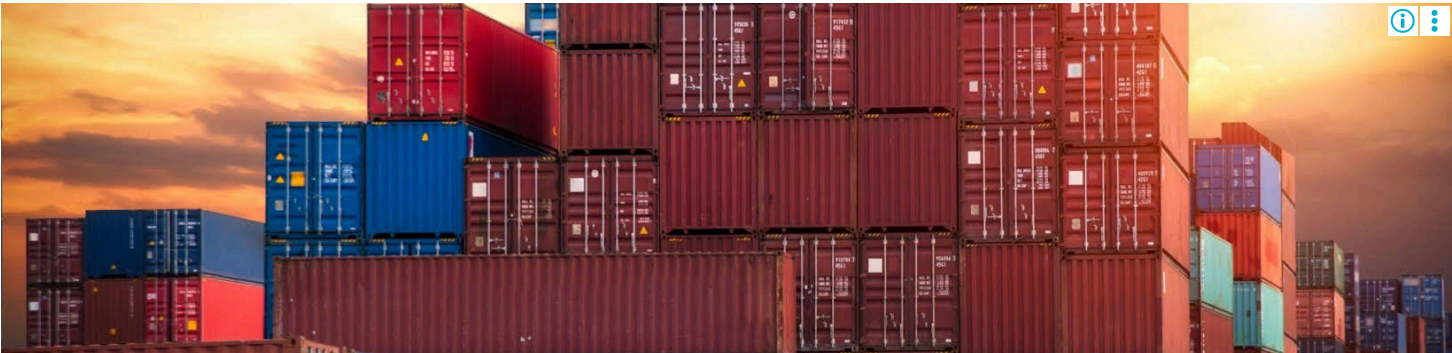

In a separate demo, Korevec showed Jules upgrading a website running the deprecated Node.js version 16 to Node.js 22. Jules cloned the site's codebase in a clean virtual machine and shared a "plan" for the upgrade, which Korevec was then prompted to approve. Once the upgrade was completed, Korevec asked Jules to verify that the website still worked correctly — which Jules did.

Jules currently uses Gemini 2.5 Pro, but Korevec told TechCrunch that users will be able to switch between different models in the future.

Mistral releases a vibe coding client, Mistral Code

Kyle Wiggers — 7:00 AM PDT · June 4, 2025

French AI startup [Mistral](#) is releasing its own “vibe coding” client, Mistral Code, to compete with incumbents like Windsurf, Anysphere’s Cursor, and GitHub Copilot.

Mistral Code, a fork of the open source project Continue, is an AI-powered coding assistant that bundles Mistral’s models, an “in-IDE” assistant, local deployment options, and enterprise tools into a single package. A private beta is available as of Wednesday for JetBrains development platforms and Microsoft’s VS Code.

use AI tools in their development processes last year.

THE MISTRAL CODE CLIENT AND DASHBOARDS IMAGE CREDITS:MISTRAL

Mistral Code is said to be powered by a combination of in-house models including Codestral (for code autocomplete), Codestral Embed (for code search and retrieval), Devstral (for “agentic” coding tasks), and Mistral Medium (for chat assistance). The client supports more than 80 programming languages and a number of third-party plug-ins, and can reason over things like files, terminal outputs, and issues, the company said.

Mistral claimed that customers including consulting firm Capgemini, Spanish and Portuguese bank Abanca, and French national railway company SNCF are using Mistral Code in production.

“Customers can fine-tune or post-train the underlying models on private repositories or distill lightweight variants,” Mistral explained in its blog

Mistral said it plans to continue making improvements to Mistral Code and contribute at least a portion of those upgrades to the Continue open source project.

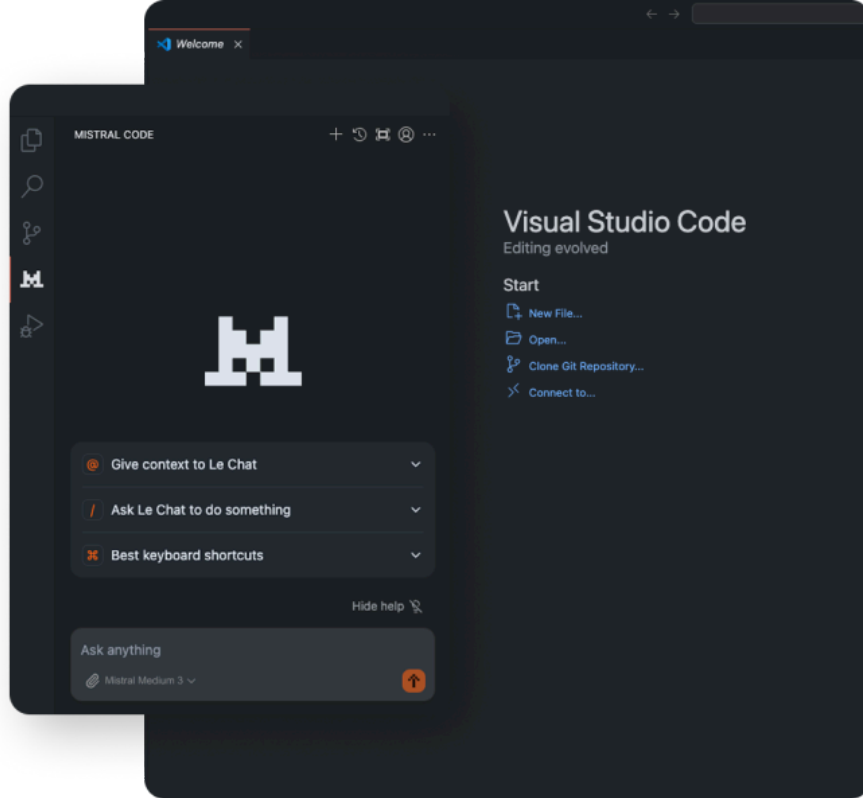

IMAGE CREDITS:MISTRAL

Founded in 2023, Mistral is a frontier model lab building a range of AI-powered services, including a chatbot platform, Le Chat, and mobile apps. It is backed by venture investors like General Catalyst, and has raised over €1.1 billion (roughly \$1.24 billion) to date.

A few weeks ago, [Mistral](#) launched the aforementioned Codestral, Devstral, and Mistral Medium models. Around the same time, the company rolled out Le Chat Enterprise, a corporate-focused chatbot service that offers tools like an AI agent builder, and integrates Mistral’s models with third-party services like Gmail, Google Drive, and SharePoint.

ENTERPRISE

Google's GitHub Copilot competitor is now generally available and will soon use the Gemini model

Frederic Lardinois — 7:00 AM PST · December 13, 2023

Google today announced that [Duet AI for Developers](#), the suite of AI-powered assistance tools for code completion and generation the company announced [earlier this year](#), is now generally available and that it will start making use

TEC DISRUPT

October 27-29, 2025 | San Francisco

Put your brand in front of 10,000+ tech and VC leaders across all three days of

of Google's more powerful Gemini model in the coming weeks.

While code completion and generation tools have quickly become mainstream, with GitHub's Copilot having the lead in terms of developer mindshare, Google is taking an interesting approach here by also partnering with 25 companies that have contributed datasets for their platforms to assist developers with building and troubleshooting their applications. Confluent, HashiCorp and MongoDB, for example, will provide data to train Duet AI for Developers to help developers with writing code for their platforms.

IMAGE CREDITS: GOOGLE

While the data from those partners will mostly be useful in the code completion and generation experience, Datadog, JetBrains and LangChain will provide documentation and knowledge sources that will likely be most useful in the Duet AI for Developers chat experience. Using this data, the service will be able to provide development and ops teams with information about how to create test automation, resolve issues in production and remediate vulnerabilities, for example.

"I still pretend to be a developer and lead a team of engineers who do developer relations and all of our documentation," explained Richard Seroter, the chief evangelist for Google Cloud, in a small press briefing ahead of today's launch. "We get to see every day, there's still plenty of toil, there's still

Disrupt 2025. Amplify your reach, spark real connections, and lead the innovation charge. Secure your exhibit space before your competitor does.

plenty of hard things about software. How can AI help get rid of that boilerplate, things that we don't like to do? How do we make coding better? That's been a lot of what we've been chasing with this. How do we build a sort of AI assistant that meets our developers in the tools they use, but also rub a little Google on it?"

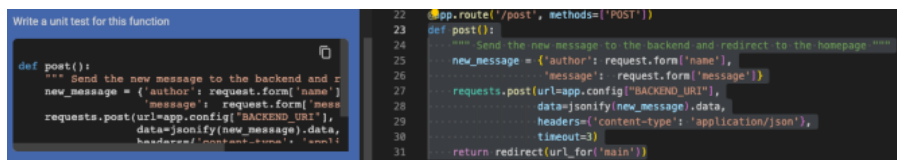

IMAGE CREDITS: GOOGLE

How do you rub a bit of Google on these tools? By ensuring that the model is trained on the latest cloud-native practices and by integrating it into the Google Cloud Console, for example, on top of all of the popular IDEs that developers use already.

Seroter stressed that Google looks at the entire family of Duet AI products, with Duet AI in Security Operations now also being generally available, as an enterprise-grade product, with enterprise access controls and Google's indemnification guarantee giving enterprises the features they need to take these tools into production.

Google's overall story around its AI coding tools is essentially the same as from every other vendor. Seroter pointed out, for example, that code completion in the IDEs developers are already familiar with helps developers stay in their flow. Just like most other vendors, Google also doesn't believe that these tools will replace coding skills but that they will help make developers more productive. GitHub and others have shared data on the productivity gains they are sharing and I expect we'll see more data from Google about that soon. For now, the company only said that [Turing](#), an "AI-powered tech services company," saw a 33% productivity gain after adopting Duet AI for Developers.

Duet AI for Developers currently supports more than 20 languages, including C, C++, Java, JavaScript and Python. On top of the usual coding capabilities, it also includes support for AI log summarization and error explanation integrated with Google's Cloud Logging, for example, as well as Smart Actions, which Google describes as one-click shortcuts to perform tasks like unit test generation.

Until the end of January 2024, Duet AI for Developers will be available for free. After that, it will cost \$19 per user per month with an annual commitment.
