Google's NotebookLM rolls out Video Overviews

Google [announced](#) on Tuesday that it's rolling out Video Overviews to NotebookLM, its AI-based note-taking and research assistant. First [introduced at Google I/O](#) in May, Video Overviews allow users to turn dense multimedia, such as raw notes, PDFs, and images, into digestible visual presentations.

Previously, the service took an audio approach to helping users understand materials with [Audio Overviews](#), a feature that gives users the ability to generate a podcast with AI virtual hosts based on documents they have shared with NotebookLM, such as course readings or legal briefs.

With this new capability, NotebookLM is taking a more visual approach to helping users understand different topics and ideas.

Google says users can think of Video Overviews as a visual alternative to Audio Overviews. The feature creates new visuals while pulling in images, diagrams, quotes, and numbers from uploaded documents to explain the content. Google says the feature is good for explaining data, demonstrating processes, and making abstract concepts easier to understand.

TECH DISRUPT

October 27-29, 2025 | San Francisco

Put your brand in front of 10,000+ tech and VC leaders across all three days of Disrupt 2025. Amplify your reach, spark real connections, and lead the innovation charge. Secure your exhibit space before your competitor does.

Users can customize their Video Overviews, just as they do with Audio Overviews. They can specify topics to focus on, indicate their learning goals, describe the target audience, and more.

They can ask simple questions like, “I know nothing about this topic; help me understand the diagrams in the paper,” or specific ones like, “I’m already an expert on X and my team works on Y; focus on Z.”

Video Overviews are now rolling out to all users in English, with support for more languages coming soon, Google says.

Google also announced that it’s rolling out updates to NotebookLM’s Studio panel. Users can now create and store multiple studio outputs of the same type in a single notebook. Plus, users will now see four tiles at the top of the Studio panel for creating Audio Overviews, Video Overviews, Mind Maps, and Reports with a single click.

In addition, users can now multitask within the Studio panel. For example, they can listen to an Audio Overview while simultaneously exploring a Mind Map or reviewing a Study Guide.

Google denies AI search features are killing website traffic

Sarah Perez — 12:45 PM PDT · August 6, 2025

Numerous studies indicate that the [shift to AI search features](#) and the use of [AI chatbots](#) are

killing traffic to publishers' sites. But Google on Wednesday denied that's the case, at least in aggregate. Instead, the search giant says that total organic click volume from its search engine to websites has been "relatively stable" year-over-year and that average click quality has slightly increased.

"This data is in contrast to third-party reports that inaccurately suggest dramatic declines in aggregate traffic — often based on flawed methodologies, isolated examples, or traffic changes that occurred prior to the roll out of AI features in Search," writes Google VP and Head of Search, Liz Reid, in [a new blog post](#).

Though Google hasn't shared any specific data to back up its conclusions, even if we assume Google's claims to be true, this doesn't necessarily mean that AI isn't having an impact.

Even Google has to admit this, as Reid acknowledges that "user trends are shifting traffic to different sites, resulting in decreased traffic to some sites and increased traffic to others."

That word "some" is doing heavy lifting here, as Google doesn't share data about how many sites are gaining or losing. And while chatbots like ChatGPT have certainly seen traffic increase in recent months, that doesn't mean online publishers aren't suffering.

Google has been revamping its search engine for years to answer more questions directly on the search results page, and now does so with AI through its “AI Overviews” that appear at the top of search results. Google also allows users to interact with an AI chatbot for some queries. Yet Google denies that this is significantly reshaping the search landscape. Rather, it points to users shifting their attention to other sites to start their queries.

Reid explains, “People are increasingly seeking out and clicking on sites with forums, videos, podcasts, and posts where they can hear authentic voices and first-hand perspectives.”

Reading between the lines, it seems like Google.com isn’t necessarily people’s first stop on the web these days. (Google denies this, telling us that Reid’s commentary is only reflective of trends it’s seeing in traffic to sites from Google.)

However, we’ve seen this trend for some time. Back in 2022, a Google exec even said that social sites like TikTok and Instagram [were eating into Google’s core products](#), like Search and Maps.

“In our studies, something like almost 40% of young people, when they’re looking for a place for lunch, they don’t go to Google Maps or Search,” said Google SVP Prabhakar Raghavan, who ran the company’s Knowledge and Information organization at the time (he is now its chief technologist). “They go to TikTok or Instagram,” he noted.

Google has also long been worried that Amazon.com had become people’s first stop for online shopping searches, and Reddit.com had become the first stop for researching topics of interest.

Advertisement

Over many years, the company has tried to come up with compelling features for both consumers and retailers that would attract more users to Google Shopping. These efforts have included [universal shopping carts](#), [local inventory checks](#), [deal finders](#), [shopping from product images on websites](#), and more. It even [made its Shopping listings free](#) for merchants in 2020.

Meanwhile, as users [complained that Google Search quality was declining](#), the search giant was seeing so much demand for Reddit that it finally [added a “Reddit” filter](#) to allow users to narrow down results on relevant search queries. (Now that filter simply reads “forums.”)

So perhaps there’s some truth in Google’s denials — it’s not AI that’s entirely responsible for killing search. Search was already dying.

IMAGE CREDITS: SMITH COLLECTION/GADO / GETTY IMAGES

Google’s new blog post also attempts to move the goalposts a bit about what it means for websites receiving Google’s clicks. Now, instead of counting clicks, it wants publishers to think about click quality.

The company says average click quality has increased, and Google is sending “slightly more quality clicks” to websites than a year ago. (Google

explains that a quality click is one where users don't quickly click back — they stay and read.) How much of an increase, though, Google doesn't say. The company only points out that when people click through on an AI response to the source, they're more likely to dive deeper, so those clicks are more valuable.

What's more, Google paints AI as an opportunity for web publishers to gain increased exposure, saying that "with AI Overviews, people are seeing more links on the page than before," Reid writes. "More queries and more links mean more opportunities for websites to surface and get clicked."

But AI, [while a growing referral source](#), isn't [yet making up the difference](#) in terms of clicks, reports have shown. One recent study from Similarweb indicates that the number of news searches on the web resulting in zero clicks to news websites has grown from 56% (when Google launched AI Overviews in May 2024) to 69% as of May 2025.

IMAGE CREDITS:SIMILARWEB

Google appears to know this is a trend, too, as it recently launched [a product for publishers](#) that helps them monetize their dwindling traffic in other

ways that don't rely only on advertising, like micropayments or newsletter sign-ups.

The fact that Google is pushing this “AI is not the end of search traffic!” PR now only makes the situation seem more dire. It's as if Google wants publishers to believe not what their own eyes — and graphs and charts — tell them, but instead take comfort in the fact that Google still sends “billions of clicks to websites” every day, just as the post claims.

Updated after publication with a comment from Google.

Google says the feature will help users uncover the “why” and “how” behind concepts.

“Whether you’re preparing for an exam about enzymes, starting the first draft of a paper on the importance of bee populations in supporting our food systems, or exploring your passion for photography, Guided Learning is a collaborative thinking partner that helps you get it — each step of the way,” wrote Maureen Heymans, Google’s VP of Learning & Sustainability, in the [blog post](#).

In addition to the new feature, Google announced that it’s working to make Gemini as a whole better equipped to help users learn. Gemini will now automatically incorporate images, diagrams, and YouTube videos directly into responses to help users better understand complex topics. Plus, users can now also ask Gemini to create flashcards and study guides based on their quiz results or other class materials.

Google's AI coding agent Jules is now out of beta

Jagmeet Singh — 9:00 AM PDT · August 6, 2025

Google on Wednesday launched its AI coding agent, Jules, out of beta, just over two months after its [public preview debut in May](#).

Powered by Gemini 2.5 Pro, Jules is an asynchronous, agent-based coding tool that integrates with GitHub, clones codebases into Google Cloud virtual machines, and uses AI to fix or update code while developers focus on other tasks.

Google [initially announced](#) Jules as a Google Labs project in December and made it [available to beta testers](#) through a public preview at its I/O developer conference.

Kathy Korevec, director of product at Google Labs, told TechCrunch that the tool's improved stability drove the decision to take it out of beta after receiving hundreds of UI and quality updates during its beta phase.

"The trajectory of where we're going gives us a lot of confidence that Jules is around and going to be around for the long haul," she said.

With the wider rollout, Google introduced structured pricing tiers for Jules, starting with an "introductory access" free plan capped at 15 individual daily tasks and three concurrent ones, down from the 60-task limit during beta. Jules' paid tiers are part of the Google AI Pro and Ultra plans, which are priced at \$19.99 and \$124.99 a month, and offer subscribers 5x and 20x higher limits, respectively.

Korevec noted that Jules' packaging and pricing are based on "real usage" insights gathered over the past couple of months.

"The 60-task cap helped us study how developers use Jules and gave us the information we needed to design the new packaging," she said. "The 15/day is

designed to give people a sense of whether Jules will work for them on real project tasks.”

Google also updated Jules’ privacy policy to be more explicit about how it trains AI. If a repository is public, its data may be used for training, but if it is private, Korevec said that no data is sent.

“We got a little bit of feedback from users that it [the privacy policy] wasn’t as clear as we thought it was, and so most of it is just responding to that. We didn’t change anything about what we’re doing on the training side, but we changed the language,” Korevec said.

During the beta, Google said that thousands of developers tackled tens of thousands of tasks, resulting in over 140,000 code improvements shared publicly. Initial feedback led the Google Labs team to add new capabilities, including reusing previous setups for faster task execution, integrating with GitHub issues, and supporting multimodal input.

IMAGE CREDITS: JULES / X

The two primary users of Jules so far are the AI enthusiasts and professional developers, Korevec said.

By running asynchronously in a virtual machine, Jules stands apart from top AI coding tools like Cursor, Windsurf, and Lovable, which all work

synchronously and require users to watch the output after each prompt.

“Jules operates like an extra set of hands ... you can basically kick off tasks to it, and then you could close your computer and walk away from it if you want and then come back hours later. Jules would have those tasks done for you, versus if you were doing that with a local agent or using a synchronous agent, you would be bound to that session,” Korevec explained.

This week, Jules received a deeper integration with GitHub to [open pull requests automatically](#) — just like it could open branches — and a feature called [Environment Snapshots](#) to save dependencies and install scripts as a snapshot for faster, more consistent task execution.

From vibe coding to mobile use, beta trials informed Jules’ development

Since entering public beta, Jules has logged 2.28 million visits worldwide, 45% of them from mobile devices, per data from market intelligence provider [SimilarWeb](#), reviewed by TechCrunch. India was the top market for traffic, followed by the U.S. and Vietnam.

Google did not share specifics on Jules’ user base and its top geographies.

Korevec told TechCrunch that during the beta, the team observed that many people used Jules from traditional vibe-coding tools to either fix bugs that might have been implemented or extend the vibe-coded project to make it more production-ready.

Originally, Jules required users to have an existing codebase. But Google soon realized many potential

users — like those trying other AI tools — might want to explore it without one. Korevec said the company quickly enabled Jules to work even with an empty repository. That helped increase its scope and usage.

Google Labs’ team also noticed an increasing number of users accessing Jules through their mobile devices. Although the tool does not have a dedicated mobile app, Korevec said users were accessing it through its web app.

“Since it’s a big use case that we’re seeing emerging, we’re absolutely exploring what the features are that people need on mobile a lot more,” she noted.

Alongside beta testers, Korevec stated that Google already uses Jules to help develop some projects internally, and there is now a “big push” to use the tool on “a lot more projects” at the company.
