Hacker used a voice phishing attack to steal Cisco customers' personal information

Lorenzo Franceschi-Bicchierai

— 8:03 AM PDT · August 5, 2025

A cybercriminal tricked a Cisco representative into granting them access to steal the personal information of Cisco.com users, [the company said on Tuesday](#).

Cisco said it discovered the breach on July 24, blaming the incident on a voice phishing or “vishing” call. The hackers accessed and exported “a subset of basic profile information” from the database of a third party cloud-based customer relationship management (CRM) system, according to the company’s disclosure.

Cisco said that the stolen data included the customer’s name, organization name, address, Cisco assigned user ID, email address, phone number, and account-related metadata,” such as the account creation date.

The networking tech giant did not specify how many Cisco.com users were affected by the breach. When reached by email, Cisco spokesperson Carro Halpin would not say.

As [Bleeping Computer noted](#), this breach could be another one in a string of attacks that targeted companies’ Salesforce data, including [U.S. insurance giant Allianz Life](#), luxury retailer Tiffany and Co., [Australian airline Qantas](#), and others.

Cisco is a known customer of Salesforce, according [to the cloud giant](#).

Hacker leaks millions more 23andMe user records on cybercrime forum

Lorenzo Franceschi-Bicchierai

— 9:33 AM PDT · October 18, 2023

IMAGE CREDITS:

PAUL MORRIS/BLOOMBERG VIA GETTY IMAGES

The same hacker who leaked a trove of user data stolen from the genetic testing company 23andMe two weeks ago has now leaked millions of new user records.

On Tuesday, a hacker who goes by Golem published a new dataset of 23andMe user information containing records of four million users on the known cybercrime forum BreachForums. TechCrunch has found that some of the newly leaked stolen data matches known and public 23andMe user and genetic information.

Golem claimed the dataset contains information on people who come from Great Britain, including data from “the wealthiest people living in the U.S. and Western Europe on this list.”

23andMe spokesperson Andy Kill said in an emailed statement that the company was made aware of this new leak today, and that it is “reviewing the data to determine if it is legitimate.”

On October 6, 23andMe [announced that hackers had obtained some user data](#), claiming that to amass the stolen data the hackers used credential stuffing — a common technique where hackers try combinations of usernames or emails and corresponding passwords that are already public from other data breaches.

switching on multi-factor authentication. On its official page addressing the incident, 23andMe said it has launched an investigation with help from “third-party forensic experts.” 23andMe blamed the incident on its customers for reusing passwords, and an opt-in feature called [DNA Relatives](#), which allows users to see the data of other opted-in users whose genetic data matches theirs. If a user had this feature turned on, in theory it would allow

hackers to scrape data on more than one user by breaking into a single user's account.

There are still a lot of unanswered questions about this incident. It's not known if the hackers actually used credential stuffing and not another technique to steal the data, how much user data was stolen, and what the hackers intend to do with it.

The incident appears to have been conducted, or at least launched, several months ago. On August 11, a hacker on another cybercrime forum called Hydra advertised a set of 23andMe user data. That set of user data matched some of the user records leaked two weeks ago, according to a TechCrunch analysis.

On Hydra, the hacker claimed to have 300 terabytes of 23andMe user data, though the hacker did not provide any evidence for this claim.

Regardless of the many unanswered questions, what's clear is that we still don't know the full extent

of this data leak. And it's not clear that 23andMe knows yet how much data was taken.

UPDATE, October 18, 5:32 p.m. ET: This story was updated to include the statement from 23andMe's spokesperson.

Threat actor scraped Dell support tickets, including customer phone numbers

Lorenzo Franceschi-Bicchierai

— 9:47 AM PDT · May 14, 2024

The person who [claimed to have stolen the physical addresses of 49 million Dell customers](#) appears to have taken more data from a different Dell portal, TechCrunch has learned.

The newly compromised data includes names, phone numbers and email addresses of Dell customers. This personal data is contained in customer “service reports,” which also include information on replacement hardware and parts, comments from on-site engineers, dispatch numbers and, in some cases, diagnostic logs uploaded from the customer’s computer.

Advertisement

Latest in Security

Several reports seen by TechCrunch contain pictures apparently taken by customers and uploaded to Dell seeking technical support. Some of these pictures contain metadata revealing the precise GPS coordinates of the location where the customer took the photos, according to a sample of the scraped data obtained by TechCrunch.

TechCrunch has confirmed that the customers' personal information appears genuine.

This is the second disclosure of exposed Dell customer data in as many weeks. Last week, [Dell notified customers that it had experienced a data breach](#), saying in an email that the technology giant was investigating "an incident involving a Dell portal, which contains a database with limited types of customer information related to purchases from Dell."

The stolen data included customer names and physical addresses, as well as less sensitive data, such as "Dell hardware and order information, including service tag, item description, date of order and related warranty information."

Dell downplayed the breach at the time, saying that the spill of customer addresses did not pose "a significant risk to our customers," and that the stolen information did not include "any highly sensitive customer information," such as email addresses and phone numbers.

A person who goes by the online handle Menelik claimed responsibility for both data breaches. [In an interview with TechCrunch](#), Menelik provided a sample of the data he stole, which allowed TechCrunch to verify that the data was legitimate. Menelik also provided copies of emails he sent to Dell, and the company confirmed to TechCrunch that it received an email about the data breach from Menelik.

Now, it appears Menelik found another flaw in another Dell portal, which allowed him to scrape more customer data.

“I did find something for email and phone number data,” Menelik told TechCrunch. “But I am not going to do anything with it yet. I want to see how Dell responds to current topic. [sic]”

A day after this article was published, an unnamed Dell spokesperson told TechCrunch that the company is aware of the reports and is investigating.

Menelik said that he had scraped the data of around 30,000 U.S. customers, and said that the flaws he is exploiting are similar to the bugs that allowed him to obtain the first round of 49 million customer records. But this second vulnerability prevents him from collecting the data as quickly as during the first breach.

As TechCrunch first reported, in the first breach Menelik said he was able to scrape Dell customers' data from a portal where he registered several accounts as a "partner," meaning he pretended to run companies that resells Dell products or services. Once Dell approved his requests, Menelik said he was able to brute-force customer service tags, which are made of seven digits of only numbers and consonants.

Menelik posted an advertisement on a well-known hacking forum attempting to sell the data. As of the writing of this article, the listing has been deleted, and Menelik said it's because he sold the data, although he declined to say for how much.

Asked what he plans to do with the new data, Menelik said that he hasn't decided yet.

Given that some of the scraped data contains personal information on customers in the European Union, TechCrunch reached out to Ireland's national data protection authority, which did not immediately respond to a request for comment.

UPDATE, Wednesday May 15, 2:45 p.m. ET: This story was updated to include Dell's comment.
