STARTUPS

Payment platform Lava
raises \$5.8M to build
digital wallets for the
‘agent-native economy’

IMAGE CREDITS: JJ JUMOC-CASAS

A new startup, [Lava Payments](#), aims to take on payment giants by building a solution for the modern web where AI agents now handle transactions for their customers. The idea came to founder Mitchell Jones after he left his earlier Y Combinator-backed fintech startup, Lendtable, as he began to experiment with AI.

He saw the potential to build out a system that would make using AI and agent payments simpler and more developer-friendly. While experimenting with an AI app and trying to build what he thought was something simple, he realized he quickly spent more than \$400 trying to build a basic form-filling agent.

“I kept running into the same issue,” he told TechCrunch. “I was using the same underlying models and tools again and again, but through different wrappers or platforms.” And each time, he had to start a new subscription, re-authenticate, and pay separately, “even though I was already paying for access to the core model.”

“That felt fundamentally broken,” he continued. “I didn’t want to keep rebuying access to the same thing under a different wrapper. What I wanted was a single wallet, one set of credits, and the ability to move between tools and providers without starting over every time so I could pay for what I was using.”

He decided to launch Lava Payments as a solution.

TECH DISRUPT

October 27-29, 2025 | San Francisco

Put your brand in front of 10,000+ tech and VC leaders across all three days of Disrupt 2025. Amplify your reach, spark real connections, and lead the innovation charge. Secure your exhibit space before your competitor does.

[Book Your Table >](#)

Most Popular

- Key sections of the US Constitution deleted from government’s website
- Three weeks after acquiring Windsurf, Cognition offers staff the exit door
- Roku launches Howdy, a \$2.99 ad-free streaming service
- Spotify raises subscription prices
- The uproar over Vogue’s AI-generated ad isn’t just about fashion

Lava is a digital wallet that lets merchants use usage credits to facilitate transactions.

The idea is that one set of credits working across merchants and services makes it easier for autonomous agents to make payments without needing human intervention. It works like this: A merchant can enable the Lava wallet for their customers to use and upload (credits) money to. Once a customer does that, they can take that money and use it at any merchant that also accepts Lava and any of the foundational models, like GPT and Claude, on a “pay as you go basis,” Jones said.

So, rather than having to pay for each tool, a user buys a one-time usage credit that AI agents can simply charge as they perform various tasks. No more asking the user to approve transaction after transaction.

“Without Lava, agents can’t move smoothly through the internet because they constantly get blocked when it comes time to pay,” he said. He used Google as an example, saying every time a person opens Google Maps, they don’t have to pay Google for that map, as they’ve already paid Verizon and AT&T to access the internet.

On Wednesday, the startup announced a \$5.8 million seed round led by Lerer Hippeau.

Others in this space include startups like [Metronome](#).

“We see the world as very interconnected,” Jones said about what makes his product different. “What we’re really focused on is building [for the] agent-native economy.”

Born to a working family in Dayton, Ohio, Jones said his parents always told him the best way to get

- Lina Khan points to Figma IPO as vindication of M&A scrutiny
- Your public ChatGPT queries are getting indexed by Google and other search engines

ahead was to work hard, save money, and get a good education.

“You know, a lot of the things that most people are told,” he recalled, when speaking with TechCrunch.

Jones took that advice to heart. He got a good education (Yale), held some good jobs (Goldman, Meta), and then founded some companies (the fintechs Parable and Lendtable, the latter of which was YC S20).

Jones said he met his lead investors for Lava because he went to high school with [Will McKelvey, now an investor at Lerer Hippeau](#). He said McKelvey has been following his career for a while and always wanted to work together someday, and Lava Payments was that someday.

Others in the round included Harlem Capital, Streamlined Ventures, and Westbound. The fresh capital will be used for hiring, building products, and developing go-to-market strategies.

Overall, Jones is ready for Lava to be the “invisible layer that kind of powers the AI web,” he says, especially as AI agents find themselves more and more in the checkout line.

“We should be enabling agents to move, transact, and build without friction,” he said.

“We want to make sure that AI is something that can be used by every single person, even a kid from Dayton, like myself.”

The title of this piece was updated to properly reflect what the company does.

Skyfire lets AI agents spend your money

Maxwell Zeff — 4:00 AM PDT · August 21, 2024

There’s a lot of hype about [the promise of AI agents](#) today, but payments are a huge limiting factor. Today, an AI agent might be able to plan a vacation for you independently, but a human has to step in when it’s time to input your credit card information. Skyfire Systems wants to change that.

Skyfire created a payment network specifically for AI agents to make autonomous transactions. Now, obviously, AI agents are hard to control today, so the idea of one tied to your bank account is terrifying. However, Skyfire uses a number of safeguards to prevent AI agents from overspending, making the whole thing a little less scary.

Skyfire assigns each AI agent a digital wallet with a unique identifier, where businesses can deposit a set amount of funds they want the agent to spend, so they don’t get unlimited access to a bank account. Skyfire also allows customers to set limits on how much an AI agent can spend in one transaction and over time. If an AI agent tries to overspend, it will ping a human to review it. Skyfire also offers a dashboard to view exactly how much, and where, their agent is spending.

SKYFIRE’S DASHBOARD TO TRACK AI AGENT SPENDING.

Skyfire’s co-founder and CEO Amir Sarhangi [sold his last startup, Jibe](#), to Google, and the RCS messaging protocol Jibe helped pioneer became the standard for Android’s billion users. Now he’s trying to develop an open protocol to power payments in the AI era.

“AI agents can’t do anything if they can’t make payments; it’s just a glorified search,” said Skyfire co-founder and chief product officer Craig DeWitt in an interview with TechCrunch. “Either we figure out a way where agents are actually able to do things, or they don’t do anything, and therefore, they’re not agents.”

On Wednesday, Skyfire officially launched its payment network and announced \$8.5 million in seed funding raised from Neuberger Berman, Inception Capital, Arrington Capital, and other investors. (Arrington Capital is led by Michael Arrington, the founder of TechCrunch, who left the publication in 2011.)

Skyfire is solely focused on creating the payments network these agents can transact on, and did it using blockchain technology. The founders were early executives at the cryptocurrency startup Ripple, helping to build a cross-border payments network that processed more than \$50 billion during their time there.

Businesses can deposit and withdraw U.S. dollars from Skyfire, but under the hood, the platform is converting those dollars into a digital stablecoin. Skyfire uses USDC, a digital stablecoin pegged to the American dollar's value, and holds it in a wallet tied to that agent.

Skyfire collects 2% to 3% of every transaction to generate revenue but says verification services could be another source of revenue moving forward. As AI companies struggle [to generate](#)

[returns on expensive models](#), it's possible more will turn to payments as a means to break even.

AI agents on a shopping spree

In a beta test over the last two months, some AI agents have already been spending their companies' dollars with Skyfire, the founders tell TechCrunch.

Denso, a global auto parts manufacturer, created AI agents to source materials without the help of humans. These systems could find the materials Denso wanted to buy but required humans to step in at the end of the month and conduct a wire payment. Now Skyfire enables Denso's AI agents to work truly autonomously.

Another company already using Skyfire is Payman, which allows AI to pay humans for various tasks, kind of like Fiverr. With Skyfire's platform, Payman's AI agents can now hire and fulfill payments to contract workers completely autonomously, at least in theory.

For now, Skyfire is focused on B2B use cases for its payments network. But Skyfire's CEO says that's just the beginning.

"The protocol we built will be an open protocol that any company, even a competitor, can use," said Sarhangi in an interview. "We want this to be the thing everybody uses when it comes to payments in the AI world."

Skyfire's founders believe AI agents will fundamentally shift the way things are purchased on the internet. To buy something online today, humans fill out lots of personal information and select images of traffic cones to verify your identity. Skyfire hopes its payments network makes the

interface obsolete, and your AI agent can one day just act as a secure intermediary between vendors and your bank account.

Facebook is testing
social commerce
payments in Southeast
Asia

Facebook is expanding its focus on payments with a new trial in Southeast Asia that allows users to pay for products listed on Facebook Pages with just a few clicks.

The social network is running a trial in Thailand which allows users to make a payment to a Page owner without leaving the social network. Qwik, a product powered by Southeast Asia-based fintech company 2C2P, [which raised a \\$7 million Series C last year](#), allows users to make payment via a credit card, debit card or bank transfer online, according to numerous sources with knowledge of the trial.

Facebook and 2C2P both declined to comment.

IMAGE CREDITS: [PROMESA ART STUDIO](#) / [SHUTTERSTOCK](#)

The test might sound a little bizarre to anyone in the West, where the dominance of Facebook is under question thanks to the emergence of companies like Snapchat, but in Asia — China aside — the social network is an internet staple for most people. Indeed, Asia Pacific is its largest region with 566 million monthly users, [according to Facebook's latest data](#).

That social dominance in Asia also extends to commerce, with many small and independent retailers using Facebook Pages to build and engage their audience and, of course, sell products. It's difficult to track transactions on social, but [Page365](#), a Bangkok-based startup that helps small retailers sell products via social media, [previously estimated the industry](#) to be worth over \$500 million per year in Thailand alone.

Buyer browses Facebook Page and finds an item they like

Buyer clicks the 'Message' button next to the product to express an interest in it via Facebook chat/Messenger

Seller/Page admin chats with buyer to check on stock and confirm order

Seller provides bank account details so that buyer can make a bank transfer for payment

Buyer leaves their house/office to go to the nearest ATM and wire the funds to the seller's account, buyer adds a note to the transaction with order details, address for delivery and perhaps a reference number provided by the seller

The goods are then prepared for delivery once the buyer's bank transfer is confirmed by the seller

It's a hugely cumbersome process that most people in emerging markets are forced to undertake. That's because few have internet banking, the small number who do own a credit card can't use it in this scenario, and cash-on-delivery isn't preferred by small merchants.

Details aside, the key point is that people are so keen to buy online that they'll jump through all manner of hoops to do.

The big problem for Facebook, however, is that many of these hoops don't belong to the social network.

Page365 co-founder Prathan 'Pop' Thananart told us that, among his company's base of 25,000-plus retail partners, nearly all transactions start on one social network and finish on another.

“One finding that is consistent across all our merchants, aside from customers engaging in chat-and-haggle buying behavior, is where those conversions happen. Merchants report that 80 percent of transactions are carried out across two or more platforms — most notable Facebook and Line,” he said.

That could mean buyers and sellers connect on Facebook but agree the final steps and payment via Line, Thailand’s top chat app with 30 million users in the country. Or, as is increasingly happening, Instagram is the key ‘store front’ for social commerce sellers to find their customers, with deals completed at non-Facebook properties like [Shopee](#), the social commerce app from Singapore-based unicorn Garena.

This trial, which is more like alpha stage than even beta right now, is an early indicator of Facebook’s intent to keep all the processes of the social commerce transaction on its platform.

“While chat or ‘conversational commerce’ is the up-and-coming trend in the West, it’s already a reality in emerging Southeast Asia. In Thailand, for example, 33 percent of the total e-commerce spend is already going through Facebook and Instagram and ending on Line,” Sheji Ho, Group CMO of [aCommerce](#), a startup that provides e-commerce marketing and logistics services for retailers, told TechCrunch.

TechCrunch understands that Facebook is trialling Qwik with an unspecified number of top Facebook Pages in Thailand, some of which have multiple millions of fans. Once a user taps the link, it redirects them to a new site where they can enter their credit/debit card details or provide their bank account which, with authorization, triggers a bank transfer like an ATM.

We've been in contact with a number of Facebook users who have successfully used the product this week, but we were unable to replicate the process ourselves.

We have seen screenshots of the transaction process but are not publishing them with this story since Page owners in the trial have signed NDAs and media coverage could impact their relationship with Facebook, which owns the platform that they are reliant on for a large portion of their online sales.

Multiple sources in Thailand's e-commerce space told us that Facebook is planning to widen the trials to other countries in Southeast Asia over time, but it picked Thailand first because of the large market for social media commerce.

Either way, this trial is the loudest signal to date of Facebook's interest in Southeast Asia and potentially other parts of Asia and emerging markets. The company has dabbled with commerce with [a feature to let users find local services](#) which is being tested in India and Indonesia, and, while the technology behind Qwik is hardly revolutionary, entering the payment space is a major move.

It isn't clear when the trial was started, the users we talked with began to notice it this week, but it plays into Facebook's other payments initiatives elsewhere in the world. The company has enabled peer-to-peer money transfers in the U.S., and most recently the UK. Those plays were almost certainly about raising user engagement rather than making money, and this social commerce trial is similar respect, but with an Asian twist.

Facebook might not be the only social network company stepping into this space in Southeast Asia, however. Line, which [operates its own](#)

[payment service](#) and [a shopping app](#) in some parts of the region, is also talking to small retailers with a view to launching its own new service, one source with knowledge of discussions told TechCrunch.

Southeast Asia is one of Line's most important geographies since Indonesia and Thailand are among its top four countries based on active user numbers. The Japanese company claims 218 million active users worldwide and [is reportedly planning an IPO this year](#).
