STARTUPS

This founder left Silicon Valley to challenge US defense supremacy from Athens, and investors are paying attention

In the summer of 2021, Dimitrios Kottas made a move that would be unfathomable to most Silicon Valley engineers: after leaving his coveted position as an engineering manager at Apple's Special Projects Group, he packed up his life in California and moved back to Athens to start a defense company.

Three and a half years later, his startup, [Delian Alliance Industries](#), has set up solar-powered surveillance towers that monitor some of Greece's borders around the clock and detect wildfires on remote islands, along with a pipeline of other products, including concealed sea drones designed to keep enemies at bay.

IMAGE CREDITS: TECHCRUNCH/STRICTLYVC

But Kottas' most ambitious bet isn't on any particular technology — it's really that a small Greek startup can break through Europe's notoriously splintered defense market.

This may seem like less of a gamble today, especially as defense tech has never been hotter, but Kottas' path to Delian has been a long work in progress, as he told this editor in a recent episode of [StrictlyVC Download](#).

DISRUPT

October 27-29, 2025 | San Francisco

Put your brand in front of 10,000+ tech and VC leaders across all three days of Disrupt 2025. Amplify your reach, spark real connections, and lead the innovation charge. Secure your exhibit space before your competitor does.

After earning recognition for his academic work at the University of Minnesota on [GPS-denied navigation](#) — research that he says has been cited over 1,400 times — he joined Apple in 2016, where he spent six years working on autonomous systems featuring cameras, lidars, and radars. While he said he can’t discuss specifics due to confidentiality agreements, the technologies he co-developed at Apple’s secretive division clearly helped inform what Delian is building.

“At the heart of autonomy is perception,” Kottas explained, describing how machines must understand not just where objects are but what they’re doing and what they intend to do. “This lies at the heart of autonomy, and given autonomy is going to be at the heart of all future weapon systems, that’s the core technology that’s going to drive change in the defense industry over the next decade.”

IMAGE CREDITS: DELIAN ALLIANCE INDUSTRIES (SCREENSHOT)

It wasn't just technological insight that drove his career change, though. A series of geopolitical events — watching the Armenia-Azerbaijan conflict; seeing countries look to revise their surrounding borders; and recognizing how far behind European militaries had fallen — had begun gnawing at him. “I literally lost sleep,” he said.

Tech and VC heavyweights join the Disrupt 2025 agenda

Netflix, ElevenLabs, Wayve, Sequoia Capital, Elad Gil — just a few of the heavy hitters joining the Disrupt 2025 agenda. They're here to deliver the insights that fuel startup growth and sharpen your edge. Don't miss the 20th anniversary of TechCrunch Disrupt, and a chance to learn from the top voices in tech — grab your ticket now and save up to \$600+ before prices rise.

[REGISTER NOW](#)

Rather than attempting to build the next-generation fighter jet, Kottas began with something pragmatic that he could sell more immediately: surveillance towers. The move was seemingly ripped from the playbook of 8-year-old weapons maker Anduril, which started off with software-augmented surveillance towers that it sold to U.S. Customs and Border Protection.

But Delian's newer products reveal bigger ambitions. The “Interceptigon” series features concealed autonomous aerial and sea drones and vessels designed to lie dormant until threats appear.

The most striking example is a two-meter suicide vessel that comes packed in a cylinder and is deployable months in advance on the seabed at depths where satellites and drones can't detect it. When remotely activated, it appears "out of nowhere to the enemy," Kottas told TechCrunch, adding that Delian has patented this approach, which uses commercial materials to manufacture the weapons at "large scale and really at extremely low cost."

It's a model that Kottas says doesn't exist elsewhere in the Western defense industry. It has also attracted investors who just provided Delian with \$14 million in funding. Indeed, the startup announced on Tuesday that its earlier backers, Air Street Capital and Marathon Venture Capital, have led its newest capital infusion, which brings Delian's total funding to date to \$22 million.

Here's where Kottas' story gets more complicated. Despite Delian's technological achievements and operational success in Greece, the broader European market remains a formidable challenge. U.S. officials have reportedly been [pressuring](#) European countries to continue buying weapons from U.S. outfits. Further, European countries have long favored their homegrown defense companies, a tendency that some investors believe will make it difficult for startups like Delian to scale across borders.

"That concern is stronger right now in France," Kottas acknowledged, though he argued the landscape is changing. As evidence that fragmentation is being overcome, he pointed to European Union initiatives like [Safe](#) and [ReArm Europe](#), designed to encourage cross-border defense cooperation.

The proof, he insisted, is already emerging, with companies like Portugal's Tekever achieving

[unicorn status](#), and Germany's Quantum Systems competing globally. "There are companies that raised ... a tenth of what their U.S. competitors raised, and they competed on the exact same market, and the European counterpart won," Kottas said.

IMAGE CREDITS: DELIAN ALLIANCE INDUSTRIES (SCREENSHOT)

Asked what Kottas thinks of Anduril specifically, the founder is respectful, though not intimidated. "It's definitely a generational company that is going to inspire many founders and military officers all across the planet," he said.

But he cautioned against assuming early winners. "Where we stand right now, it's like 2015 for self-driving cars ... Imagine trying to predict the winner back then."

Still, the question remains whether a Greek startup — no matter how innovative — can convince French, German, or British defense establishments to bet their national security on foreign technology. Kottas recently submitted a bid for a German tender, a test case for his thesis that a decentralized Europe can be overcome through superior technology and competitive pricing.

In the meantime, what may set Kottas apart from many defense tech entrepreneurs is how personal the mission feels. Referring to U.S. aerospace and defense giant Lockheed Martin, Kottas reflected that it's "different to build weapons in New Mexico that are going to be used on the other side of the

planet. That's one mindset, [but] it's different to build something that you know may be used to save your brother or your sister or your neighbor."

The sentiment may prove Delian's greatest asset, as it's shared by entrepreneurs across Europe who view conflict not as an abstract possibility but as a lived reality. It drives the company's focus on low-cost, rapidly deployable systems that can be churned out at scale, and explains its emphasis on tech that can be pre-positioned and activated when needed. It might also ultimately convince other European nations that geography matters more than nationality when it comes to defense.

Either way, Kottas' unconventional journey from Athens to Minneapolis to Apple and back to Athens suggests he's comfortable with long odds.

There's a "benefit of building a company" in a smaller market on a continent known for its balkanization. "It forces you to be more resilient, more efficient, and to focus ruthlessly on building great technology at a really low price point, which matters in this business," he said.

"I do think fragmentation will be overcome in the coming years, and you can turn it to your advantage if you play it right."

Final call: TechCrunch Disrupt 2025 ticket savings end tonight

TechCrunch Events — 6:00 AM PDT · August 6, 2025

TechCrunch Disrupt 2025 marks 20 years of shaping the startup world — and tonight's your last chance to save up to \$675 on your ticket.

From October 27–29, Disrupt returns to Moscone West in San Francisco. Join 10,000+ tech innovators, founders, VCs, and ecosystem builders

for three days of high-impact programming, networking, and startup energy.

But first: your savings. You have until 11:59 p.m. PT tonight to save up to \$675. Once the clock strikes midnight, prices jump. [Register now](#).

Why you won't want to miss this 20th-anniversary Disrupt

TechCrunch Disrupt has been the launchpad for breakthroughs and next-generation deals for 20 years. It's not just another tech conference — it's where game-changing innovations are born, powerful connections are made, and ideas turn into action.

One session, one meeting, one moment — that's all it takes to change your trajectory. Disrupt is where startups break out, investors find the next big thing, and industry leaders stay ahead of the curve.

Hubble Network plans massive satellite upgrade to create global Bluetooth layer

Aria Alamalhodaei — 4:00 AM PDT · August 7, 2025

IMAGE CREDITS: [MUON SPACE](#)

[Hubble Network's](#) satellite-powered Bluetooth network is getting a big upgrade.

The Seattle-based startup, which aims to bring to enterprises what Apple's Find My has brought to consumers, has built a powerful new phased-array receiver that will enable what Hubble CEO Alex Haro calls a "true Bluetooth layer around the Earth."

This advanced payload will fly on two massive new satellites from four-year-old [Muon Space](#), called MuSat XL, which are slated to launch in 2027. The first two MuSat XL spacecraft will deliver a 12-hour global revisit time and detect Bluetooth Low Energy (BLE) signals at 30 times lower power than current capabilities, Hubble says. If those numbers pan out, it could materially extend battery life for tracking tags and sensors here on Earth.

Those two satellites will form the backbone of Hubble's BLE Finding Network for enterprises in sectors ranging from logistics, infrastructure, and defense.

Hubble [made history in 2024](#) when it became the first company to establish a Bluetooth connection directly to a satellite. The startup's proposition is compelling: Instead of needing to buy specialized hardware, customers will only need to integrate their devices' chipsets with a piece of firmware to enable connection to the Hubble network.

The benefits of the space-based network are massive, Hubble argues: It can provide visibility across the globe, including in remote areas, and offers a developer-friendly way to let companies

track assets without building any additional infrastructure.

The company currently has seven spacecraft on orbit with a target of having 60 satellites in operation by 2028. The long-term goal is to upgrade the entire constellation to the larger platform buses because of their power and performance upgrades, Haro said.

[REGISTER NOW](#)

It's an aggressive schedule, but Haro added that one reason Hubble chose to partner with Muon is the latter's ability to rapidly scale manufacturing to hit this goal, despite being a young company. (A recent [\\$146 million funding round](#) should help.) Gregory Smirin, president of Muon Space, told TechCrunch that the company's San Jose production facility is being built out to support production of over 500 spacecraft per year by 2027.

Hubble is the first customer for the 500 kilogram-class MuSat XL satellite platform, which Muon says

can provide multi-kilowatt power to payloads, optical crosslinks, high-volume downlink, and “near real-time” communications for time-sensitive missions. The partnership also signals a bigger push by the company to compete for more lucrative contracts with the Department of Defense.

The XL platform “is a perfect size and capability for SDA Tranche missions,” Smirin said, referring to the Space Development Agency’s initiative to build out a missile defense constellation in low Earth orbit. “XL reflects both the evolution of our technical stack and our growing role in delivering the kind of multi-mission spacecraft that programs like SDA increasingly rely on.”

Muon’s business model can be thought of as [space-as-a-service](#): The company designs, builds, and operates satellites using a vertically integrated stack of hardware and software. The stack, called Halo, is meant to open up space access for companies with promising payloads but no interest in building the underlying satellite architecture. In practice, that means Hubble can focus on developing the BLE network while Muon handles the satellite platforms and mission operations.
