Chrome for iOS makes it
easier to switch between
work and personal
Google accounts

Google announced Monday that it's introducing a new feature that lets iOS users easily switch between work and personal Google accounts in Chrome. Previously, iOS users had to completely sign out of their Google account and then log in with another, and repeat this process every time they wanted to access a different account.

"Many of us use our mobile devices for both work and personal tasks, often juggling multiple Google Accounts," [Google wrote in a blog post](#). "This can mean constantly signing in and out. Chrome is now offering support for managed account browsing that creates strict data separation from other browsing and seamless switching between accounts."

IMAGE CREDITS: SEAN GALLUP / GETTY IMAGES

When users sign in or switch to their work Google account in Chrome, browsing related to their organization will be kept separate from their other browsing on the device. Local data and content, including tabs, history, and passwords, stay only within the managed account browsing experience. Google says this is ideal for both end users and IT admins.

The update comes as Google says many organizations are moving away from company phones, which means employees often have to access company resources from their personal phones and computers. Google says the improved account switching experience and data separation

The first time users sign in or switch to a managed account, they will see an onboarding screen that explains the separation of managed account browsing and how their organization is handling their data.

Organizations maintain control and can decide how existing browsing data is handled when a user initially signs in or switches to a managed account. Once users switch to their managed account, they are notified that they're entering a managed experience.

Google also announced that it has incorporated more advanced security features that IT departments can implement.

Chrome Enterprise’s reporting capabilities are now extending to both Android and iOS, which means organizations can now send critical data related to security events to the security investigation tool in the Google Admin console, Chrome logs, or the SIEM of their choice. Google says this allows IT teams to make more informed decisions about overall security.

Google is also bringing URL filtering to iOS, allowing organizations to do things like block employees from visiting prohibited GenAI sites at a category level and redirect them to the approved corporate services.

Chrome For iOS Market Share Reaches 2.7%

Frederic Lardinois — 9:10 AM PDT · September 13, 2012

Google launched Chrome for iOS in June. By mid-July, Google's browser for Apple's mobile operating system had managed to get about 1.5% of the market and has been adding new users ever since, despite the fact that Apple makes it very hard for its users to switch browsers. Now, according to the [latest data](#) from online advertising service [Chitika](#), Chrome for iOS drives 2.7% of all iOS web traffic to the sites in its network. Depending on the hour of the day, says Chitika, traffic from Chrome for iOS is often above 5% and peaked at 6.83% on September 7.

Every weekday and Sunday, you can get the best of TechCrunch's coverage.

Obviously, Chrome for iOS is not a huge hit and Chitika's analysts note that "considering the fact that Chrome for iOS spent nearly a month as the top free app for iOS devices, the Chitika Insights team expected it would make more of an impact on the market than it has thus far."

One thing Google has going for it in terms of getting a bit more market share is that it recently added an "open in Chrome" feature to its Gmail and Google+ apps for iOS. Other apps, including the now [Google-owned Sparrow for iPhone](#) offer a similar feature.

It's unlikely that Apple will give users the option to make a third-party browser the default browser on iOS anytime soon. Still, almost 15% of all the iOS web traffic to Chitika's network comes from third-party browsers.

Google improves search experience in the Chrome mobile app

Lauren Forristal — 12:16 PM PDT · June 26, 2024

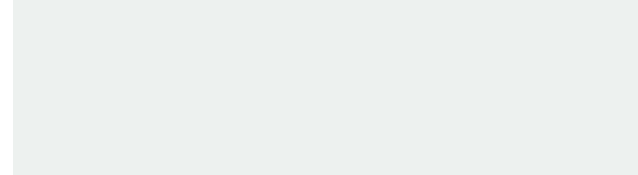

Facing new competition from [startups like Arc](#), Google [announced](#) on Wednesday that it’s bringing five new features to the Chrome browser on mobile devices, each designed to enhance the search experience. These include new shortcuts for local search results, a refreshed address bar for easier navigation, trending search suggestions, live

sports cards for fans, and more personalized search recommendations to cater to users' browsing habits. The features will roll out soon for both Android and iOS devices.

Among the new features is Chrome Actions, which helps users more easily perform certain tasks without going to settings. Now the feature is coming to local search results, meaning users will be able to search for a local business and quickly get access to shortcut buttons like “Call,” “Directions,” and “Reviews.”

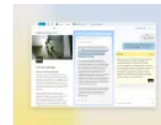

This is currently available in Chrome on Android devices, and Google will launch an iOS version later this fall.

Google has also enhanced the Chrome address bar for iPads and Android tablets. The new design ensures that users can open the Chrome address bar and still view the web page they’re currently on, making full use of the larger tablet screens for a better browsing experience.

Additionally, the Chrome browser on iOS and Android devices will feature new shortcut suggestions based on past searches. The company explained that if someone types in “schedules” in Chrome and often clicks on the City Metro website, that website will now appear higher up in the

search suggestions whenever the user searches “schedules.”

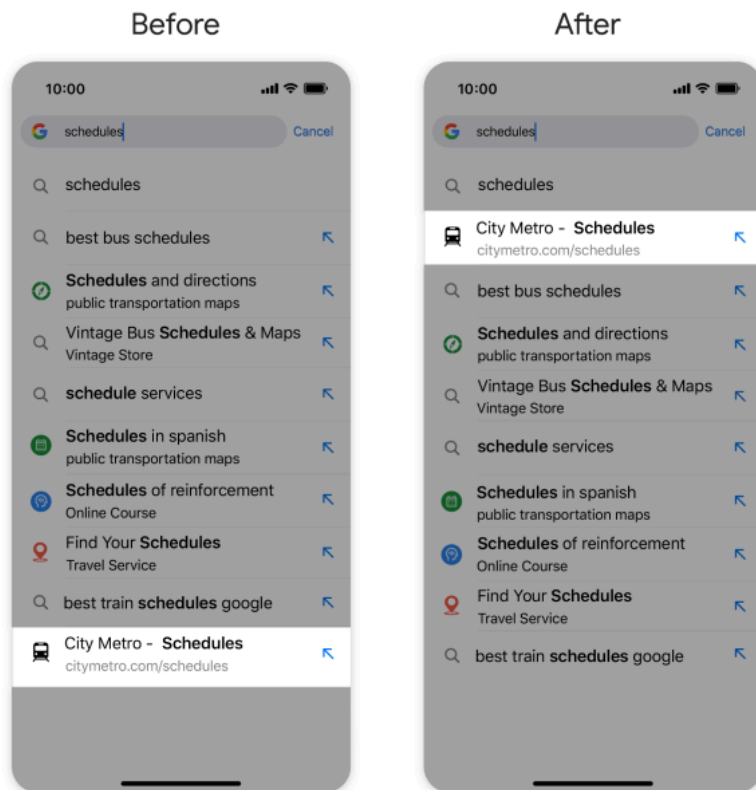

IMAGE CREDITS:GOOGLE

Another useful feature is trending searches, which were previously only available on Android devices. Google is finally bringing trending search suggestions to the Chrome address bar on iOS, giving users the ability to see what popular searches are happening across Google Search.

Google also launched live sports cards on its mobile version of Chrome’s Discover Feed to let users know when their favorite sports team is playing and to provide automatic updates with the latest scores and highlights from recent games. Users can customize the feature by selecting the three-dot menu in the Chrome mobile app.
