AI

DuckDuckGo now lets  
you hide AI-generated  
images in search results

Privacy-focused browser DuckDuckGo is [rolling out](#) a new setting that lets users filter out AI images in search results. The company says it's launching the feature in response to feedback from users who said AI images can get in the way of finding what they're looking for.

Users can access the new setting by conducting a search on DuckDuckGo and heading to the Images tab. From there, they will see a new drop-down menu titled "AI Images." Users can then choose whether they want to see AI content by selecting "show" or "hide."

Users can also turn on the filter in their search settings by tapping the "Hide AI-Generated Images" option.

# Privacy-Focused Search Engine DuckDuckGo Gets A New Look, Smarter Search With “Instant Answers”

Sarah Perez — 9:14 AM PDT · May 20, 2014

[DuckDuckGo](#), the privacy-focused search engine [whose popularity grew last year](#) following the NSA and PRISM leaks, is today rolling out an updated interface for its website, which features “smarter search,” plus a new, cleaner design and improvements related to photo search, video search, place search, and more.

Key to the new release are a number of features users have been requesting, including images, local search, auto-suggest, and others, explains CEO Gabriell Weinberg. These changes are meant to take DuckDuckGo another step closer toward being more competitive with search giant Google –

Advertisement

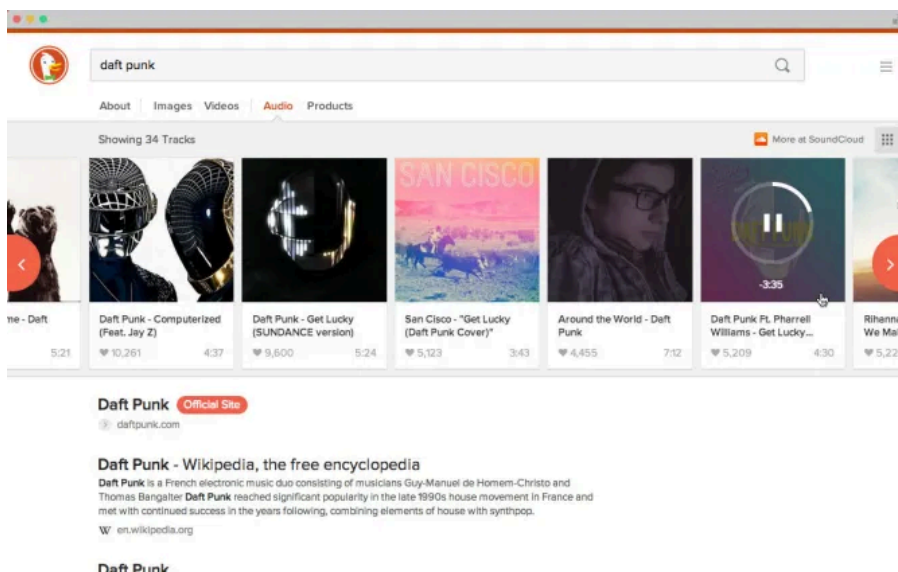

at least for the smaller user base who chooses DuckDuckGo because of its un-creepy [policies](#).

The search engine, for those unfamiliar, doesn't use tracking cookies and doesn't save a record of your IP address, [among other things](#).

The company has recently benefitted from consumer awareness around Internet privacy, and the government's involvement in collecting data from major Internet companies. Before Edward Snowden's revelations, DuckDuckGo saw 54.4 million requests per month. The month after, it exploded to 105.6 million requests. Today, the company says they received over a billion searches last year, and have tripled their searches since just last summer when the revelations began.

## Images, Videos And Places

At the top of a DuckDuckGo search results page, there are now links to specific verticals, like images, video, audio, or places for example, depending on the type of search. The company demonstrates some samples searches [here](#), with a search for "Daft Punk," for instance, directing users to links, photos, video, audio and products, as well as showing 34 track thumbnails in a scrollable interface at the top of the page, plus a link to SoundCloud.

## Tech and VC heavyweights join the Disrupt 2025 agenda

Netflix, ElevenLabs, Wayve, Sequoia Capital — just a few of the heavy hitters joining the Disrupt 2025 agenda. They’re here to deliver the insights that fuel startup growth and sharpen your edge. Don’t miss the 20th anniversary of TechCrunch Disrupt, and a chance to learn from the top voices in tech — grab your ticket now and save up to \$675 before prices rise on August 7.

San Francisco | October 27-29, 2025

REGISTER NOW

For a place search, like “thai food in San Francisco,” DuckDuckGo now displays a big map interface, with thumbnails of various eateries and other details, including name, address, phone and star rating (from Yelp) below.

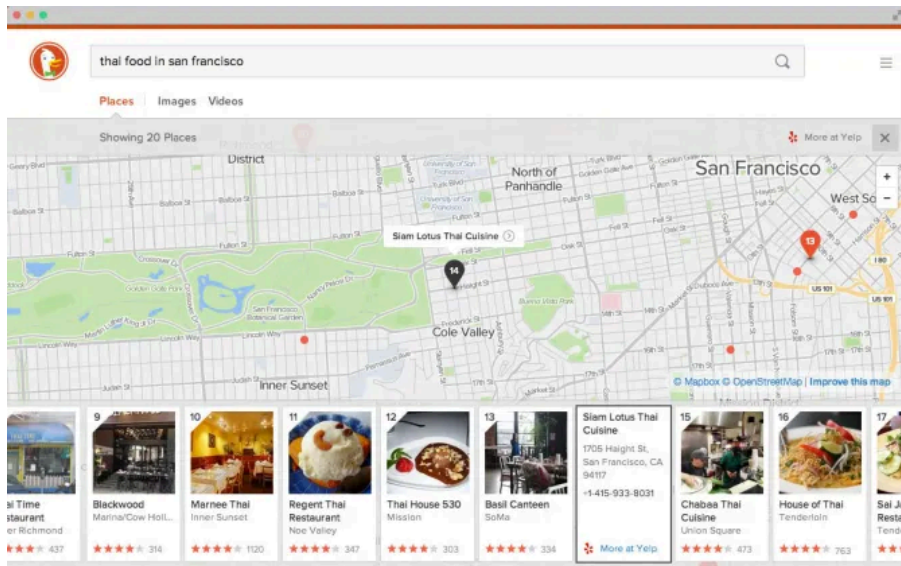

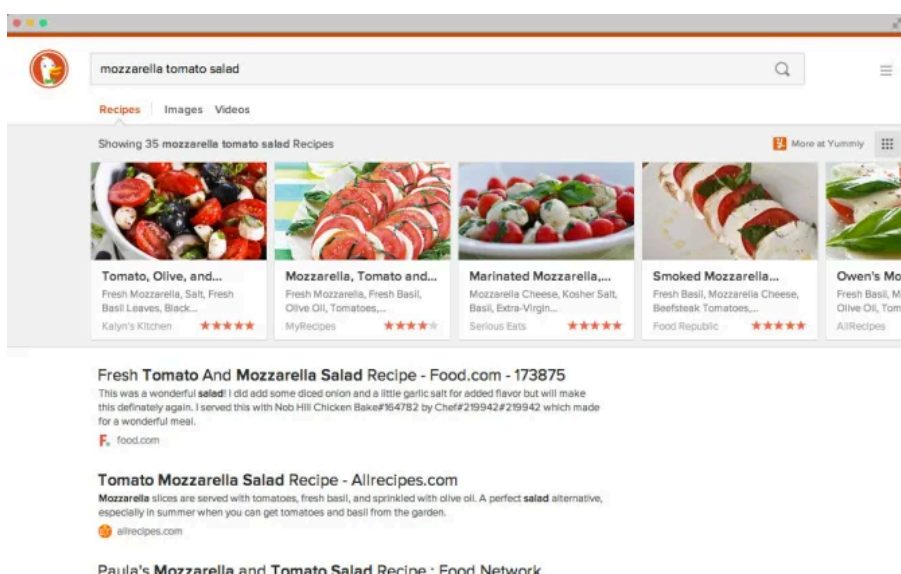

Image and videos have their own search verticals where you can now view individual files without leaving the page – there’s even a handy “download

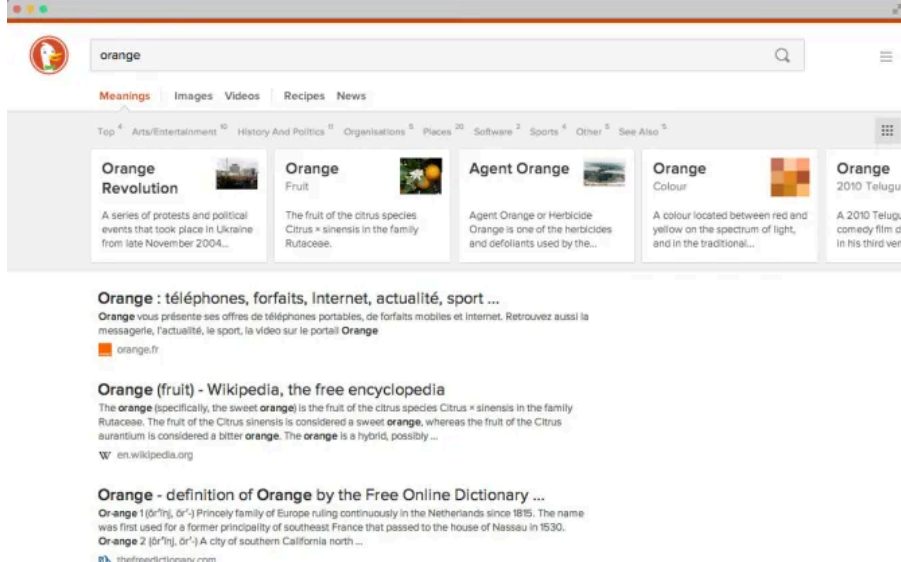

file” button available, saving you the trouble of a right-click.

## Instant Answers For Fact-Based Questions, Weather, Recipes and More

DuckDuckGo has also added a new recipe search feature that lets you type in in a type of meal, and get pointed to specific recipe photo thumbnail links aggregated from recipe search sites around the web. And a weather search will now offer instant answers for a query like “weather” followed by a city name.

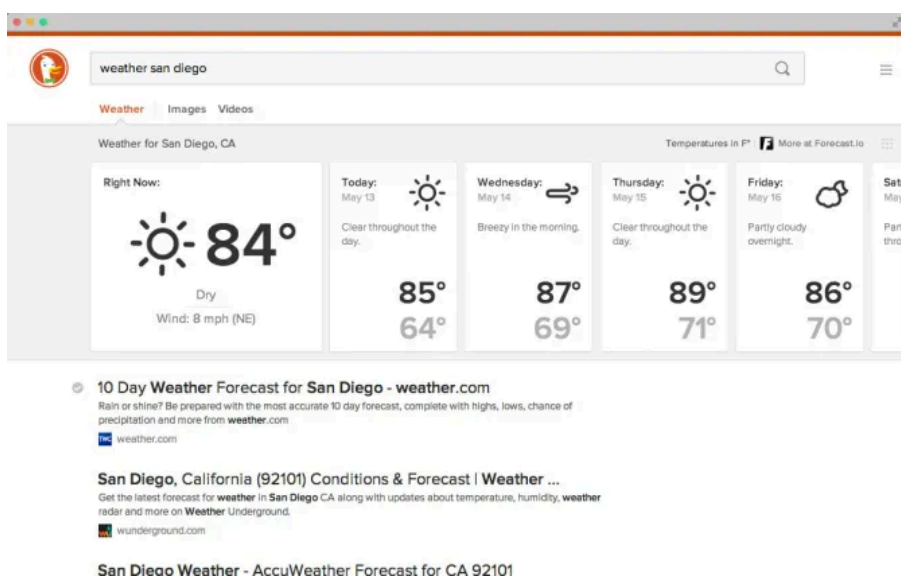

Search is also “smarter,” too, with a new “Meanings” feature that helps you better narrow down possibly ambiguous search terms by breaking up search results into categories, or letting you choose a particular search filter with a click. For example, a search for “orange” could mean the color, the fruit or could be part of a longer search query, like “Agent Orange” or “Orange Revolution.”

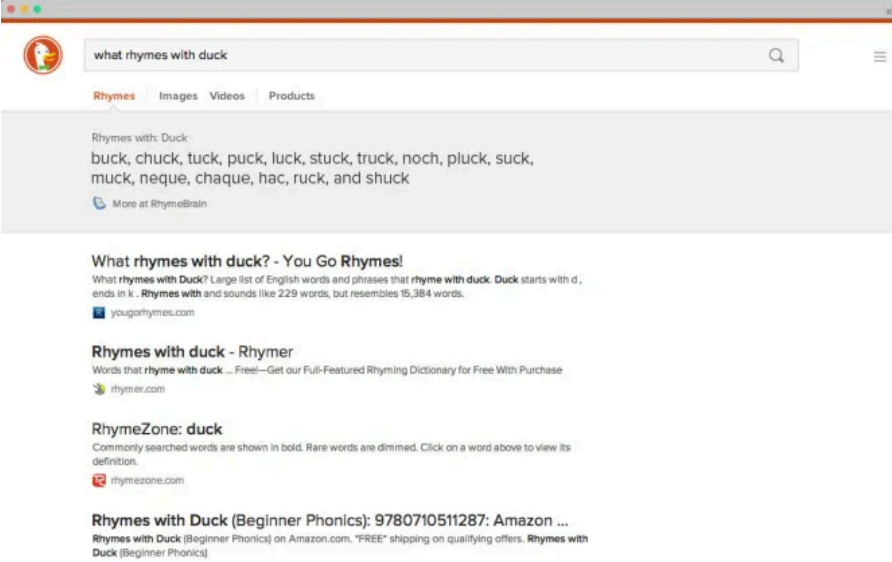

Another major improvement in terms of smarter search comes from DuckDuckGo’s instant answers implementation, where the best answer for a straightforward question is flagged at the top of the search results, just like on Google. Weinberg explains that the company is now laying the ground work for the future of [DuckDuckHack](#), its “open-source instant answer platform that anyone can contribute [ideas](#) or [code](#) to,” he says.

The way this works is that the DuckDuckGo community helps to figure out the best sources for each type of search, and then the company’s technology gets those answers and puts them above the links in the answer bar.

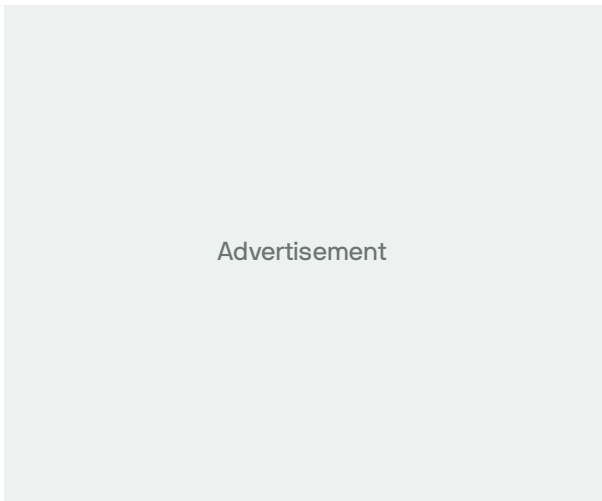

“In essence, the approach we have taken is to partner with as many data sources as possible and showcase a partner’s unique data as the answer, which is extremely useful for our users and good for them as well,” says Weinberg.

He adds that the new version of DuckDuckGo today works great on the mobile web, and that the iOS and Android apps will also be getting an update soon. For now, you can check out the update from DuckDuckGo’s main site [here](#).

## Want to branch out beyond Google? Here are some search engines worth checking out

Aisha Malik — 6:00 AM PDT · September 2, 2024

IMAGE CREDITS: ROJDESIGN / GETTY IMAGES

Google has dominated the search space for so long that a U.S. District Court judge recently found that it has [acted illegally to maintain a monopoly in online search](#). You have probably used Google Search for

as long as you can remember; it's what replaced things like phone books and encyclopedias.

But just because Google runs the most popular engine doesn't mean you have to use it. If you have never considered a search engine beyond Google, you might be surprised to see what else is out there.

There are many Google Search alternatives on the market that have gained traction. Whether you're looking for increased privacy, enhanced AI features or just something different, there are some notable options worth checking out.

While Microsoft's Bing and Yahoo are arguably the most well-known, there are tons of Google Search alternatives that have also been around for a while. But for this list, we're focusing on newer, lesser-known entrants into the search engine space. (Disclaimer: TechCrunch is owned by Yahoo.)

Now, let's get into some Google Search alternatives worth exploring.

## DuckDuckGo

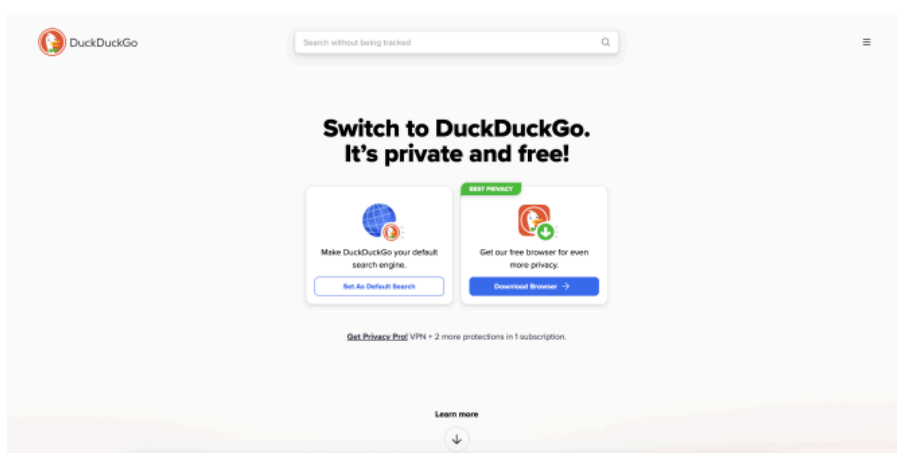

IMAGE CREDITS: DUCKDUCKGO

If you want more privacy when you search, [DuckDuckGo](#) may be the right [search engine](#) for you. DuckDuckGo doesn't track your search history, and its privacy policy outlines that it doesn't collect or share any of your personal information, unlike

Like Google, DuckDuckGo offers a safe search feature. You can choose to have it off or on a “strict” or “moderate” setting.

If you're interested in AI, DuckDuckGo gives you [anonymous access](#) to a few different AI models, including OpenAI's GPT-4o mini, Anthropic's Claude 3, Meta's Llama 3.1 and Mixtral. DuckDuckGo reassures users that their conversations won't be used to train AI.

**Ecosia**

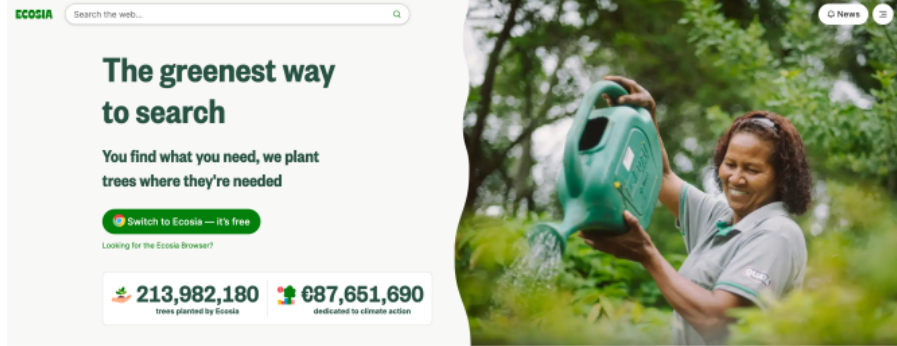

IMAGE CREDITS: ECOSIA

[Ecosia](#) is a good Google Search alternative for people who [want to help save](#) the planet. [The search engine](#) contributes to planting trees and has planted more than 213 million trees to date in over 35 countries. All of the search engine's profits go toward its tree-planting and other environmental projects.

★ SPONSORED

Design agents are here — Lovart launches the first end-to-end AI canvas for design

Sponsored by Lovart

The search engine is simple to use, and its results are powered by Google and Microsoft's Bing, so you still get the same sorts of results but also help the environment while doing so.

Ecosia uses essential cookies to provide search results, but searches are encrypted. If you do want personalized search results, you can opt into them. Ecosia will ask for your consent before enabling personalized search results and ads.

## Brave Search

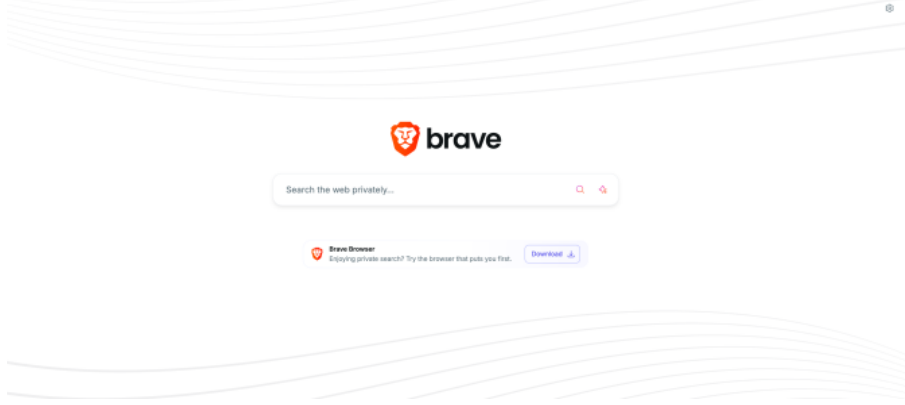

IMAGE CREDITS: BRAVE

Like DuckDuckGo, [Brave Search](#) also uses privacy as one of its selling points. The service says it doesn't share, sell or collect your personal data. Brave Search doesn't rely on other search engines and is instead built on its own [independent search index](#).

Brave surfaces [AI-powered answers](#) to most questions at the top of your search results. If you don't want AI-powered answers and only want to see standard results, you can toggle the feature off in the search engine's settings.

The search engine also has a "Discussions" section that will display content from forums like Reddit. Plus, you can refine your search results with the engine's "Goggles" feature, which lets you filter your results with options like "no Pinterest," "tech blogs," "news from the left," "news from the right" and more.

Like some other engines on this list, Brave offers a safe search feature that you can have "off" or on a "strict" or "moderate" setting.

## Startpage

Sponsored by Lovart

Startpage also lets you access unprofiled news, which means it doesn't show news based on your browsing behavior. The search engine does show you promotional content on its homepage and search results page, but you can turn this off in Startpage's settings.

The search engine operates pretty similarly to Google, but if you want to access Maps, it will send you to Google or Bing.

# Perplexity

Where knowledge begins

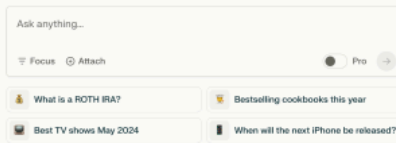

IMAGE CREDITS: PERPLEXITY

Perplexity is embroiled in a [series of controversies](#) at the moment. However, it is one of the most [popular AI search engines](#) on the market, so it's worth mentioning.

Unlike the other search engines on this list that simply offer AI features on top of their search results, Perplexity was created as an AI-powered search engine. Think of it like combining an AI chatbot with a search engine.

Perplexity uses a conversational approach to search and gives you a [concise answer](#) to a question. If you don't want a straightforward answer, Perplexity provides you with a list of websites in addition to its concise answer if you want to explore the web. Plus, there is a "related" section at the end of your search that brings up related queries that encourage further exploration.

While the search engine is free to use, you can sign up for a \$20 monthly subscription for additional features, such as access to image-generation models and the option to select your preferred AI model.

## SearchGPT

Bryce Durbin / TechCrunch

IMAGE CREDITS: BRYCE DURBIN / TECHCRUNCH

Although [OpenAI's SearchGPT](#) isn't widely available, it's definitely one to look forward to once it officially launches. Given the success of [OpenAI's other products](#), the release of SearchGPT is sure to cause a ripple in Google's Search dominance.

OpenAI has said SearchGPT will give users "fast and timely answers" to questions. You will be able to type in a query and receive information and photos from the web along with links to relevant sources. You can then ask follow-up questions or explore related searches in a sidebar.

★ SPONSORED

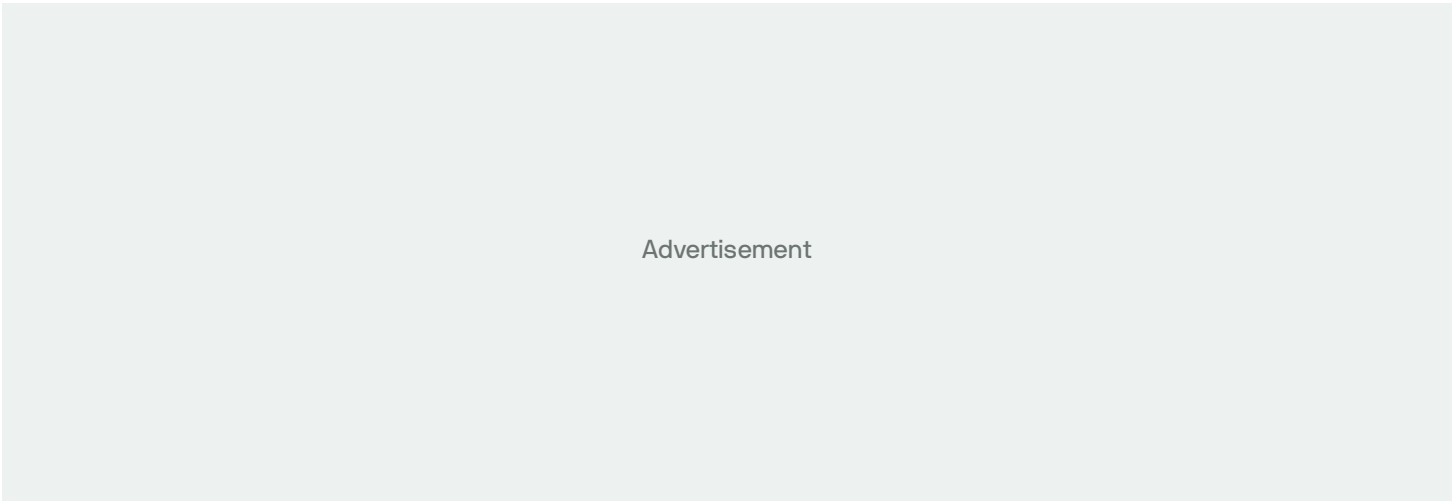

Design agents are here — Lovart launches the first end-to-end AI canvas for design

Sponsored by Lovart

Responses from the service cite and link sources so you know where the information is coming from. OpenAI has noted that since SearchGPT is about search and is separate from training OpenAI's generative AI foundation models, the service will surface results from sites even if they have opted out of generative AI training.

SearchGPT is still a prototype, so we can't say too much about it now, but it will definitely be one to check out once it's widely available.

# DuckDuckGo dabbles with AI search

Natasha Lomas — 5:00 AM PST · March 8, 2023

Privacy-focused search engine [DuckDuckGo](#) has followed [Microsoft](#) and [Google](#) to become the latest veteran search player to dip its beak in the generative AI trend — announcing the launch today in beta of an AI-powered summarization feature, called DuckAssist, which can directly answer straightforward search queries for users.

IMAGE CREDITS: [DAVID BROSSARD](#) / [FLICKR](#)

DDG says it's drawing on natural language technology from ChatGPT-maker OpenAI and Anthropic, an AI startup founded by ex-OpenAI employees, to power the natural language summarization capability, combined with its own active indexing of Wikipedia and other reference sites it's using to source answers (the encyclopedia Britannia is another source it mentions).

Founder Gabe Weinberg tells TechCrunch the sources it's using for DuckAssist are — currently — “99%+ Wikipedia”. But he notes the company is “experimenting with how incorporating other sources could work, and when to use them” — which suggests it may seek to adapt sourcing to the context of the query (so, for example, a topical news-related search query might be better responded to by DuckAssist sourcing information

**Most  
Popular**

from trusted news media). So it remains to be seen how DDG will evolve the feature — and whether it might, for example, seek to ink partnerships with reference sites.

At launch, DuckAssist is only available via DDG’s apps and browser extensions — but the company says it plans to roll it out to all search users in the coming weeks. The beta feature is free to use and does not require the user to be logged in to access it. It’s only available in English for now.

Per Weinberg, the AI models DDG is (“currently”) using to power the natural language summarization are: The Davinci model from OpenAI and the Claude model from Anthropic. He also notes DDG is “experimenting” with the new Turbo model OpenAI recently announced.

It’s worth noting that DDG’s search engine does already have an Instant Answers feature which gets triggered for certain types of queries and also serves answers directly above the usual list of links. (Example scenarios include if you’re asking the search engine to sum basic calculations, display a calendar for the current month or asking for factual snippets of info.)

However DDG says that adding in generative AI summarization has enabled it to expand how many queries can be directly answered in this way — dubbing the addition of generative AI into the mix here a “fully integrated Instant Answer”.

## **Anthropic begins supplying its text-generating AI models to select startups**

Anthropic, a buzzy AI startup co-founded by ex-OpenAI employees, has begun offering partners access to its AI text-generating models. The first commercial venture to announce that it's integrating Anthropic models is Robin AI, a

“The two main benefits compared to other instant answers are that DuckAssist answers will be more directly responsive to user questions, and that DuckAssist can answer significantly more questions,” Weinberg tells us. “The generative AI behind DuckAssist generates new text for a particular query, where standard instant answers are generally pulling out quotes. In this way, DuckAssist can be more directly responsive to the query, quickly surface information buried in articles, and synthesize information from multiple Wikipedia snippets. As a result, it can answer a wider breadth of questions.”

DuckAssist is intended to help users of the search engine find factual information more quickly — hence it only appears as an option when the technology assesses it can help with a specific query.

“If you search for a question in any DuckDuckGo app or browser extension, and DuckAssist thinks it

might be able to find an answer from Wikipedia, you may see a magic wand icon and ‘Ask Me’ button at the top of your search results,” DDG explains.

If an answer has previously been solicited by another DDG user the company says it will be displayed automatically — but it also notes that users can opt to disable Instant Answers (which includes DuckAssist) in the settings if they prefer not to be exposed to AI-generated summaries.

Weinberg says the feature works by using AI to generate new natural language responses “based on specific/relevant sections of Wikipedia articles” that DDG provides via its own scanning of sources. (He specifies DDG is using its own indexing technology “to identify the relevant chunks of text from Wikipedia, and then ask the models to format answers in a way that is directly responsive to the query”.)

Accuracy is one key concern being attached to applications of generative AI — given the technology can be prone to make up information and yet automated output that’s presented in a natural language wrapper can sound highly authoritative despite not being fact-checked.

On this, Weinberg says DuckAssist has been designed to boost the probability that it will give a correct answer while also providing users with information that the answer is automated — and pointing them to the reference sources where they can do their own fact-check (i.e. if it turns out DuckAssist is being more of an ‘ass’ than an assistant).

“A search engine’s job is to surface reliable information quickly. We designed DuckAssist in way that leverages what natural language technology does well while trying to increase the probability it will give a correct answer when it appears in search

results. We did that by intentionally limiting the sources DuckAssist is summarizing from,” he says. “For now, DuckAssist is only pulling answers from Wikipedia and a handful of related sources, like Britannica. This greatly limits the probability DuckAssist will generate incorrect information or ‘hallucinate’, where the AI tool makes up random information.

“Nevertheless, we know it won’t be right 100% of the time — If we do not provide the most relevant text [to the AI] to summarize, for example, or if Wikipedia itself has errors. In any case, we label every answer as not independently checked for accuracy and provide a link to the most relevant Wikipedia article for more info.”

On the privacy side, DDG promises this search with AI feature is anonymous — and, in line with its headline privacy pledge, further emphasizes that no data is shared with any of the third parties it’s working with to integrate the generative AI capability into its search engine. (In the blog post Weinberg also specifies that users’ anonymous searches are not being used to train its suppliers’ AI models.)

It’s asking users to give feedback on the quality of the DuckAssist summaries — via a feedback link that’s displayed next to all DuckAssist answers, as part of its approach to tackling the generative AI accuracy issue — and says this feedback is anonymous too, with user reports also only sent to DDG itself, not to any third parties.

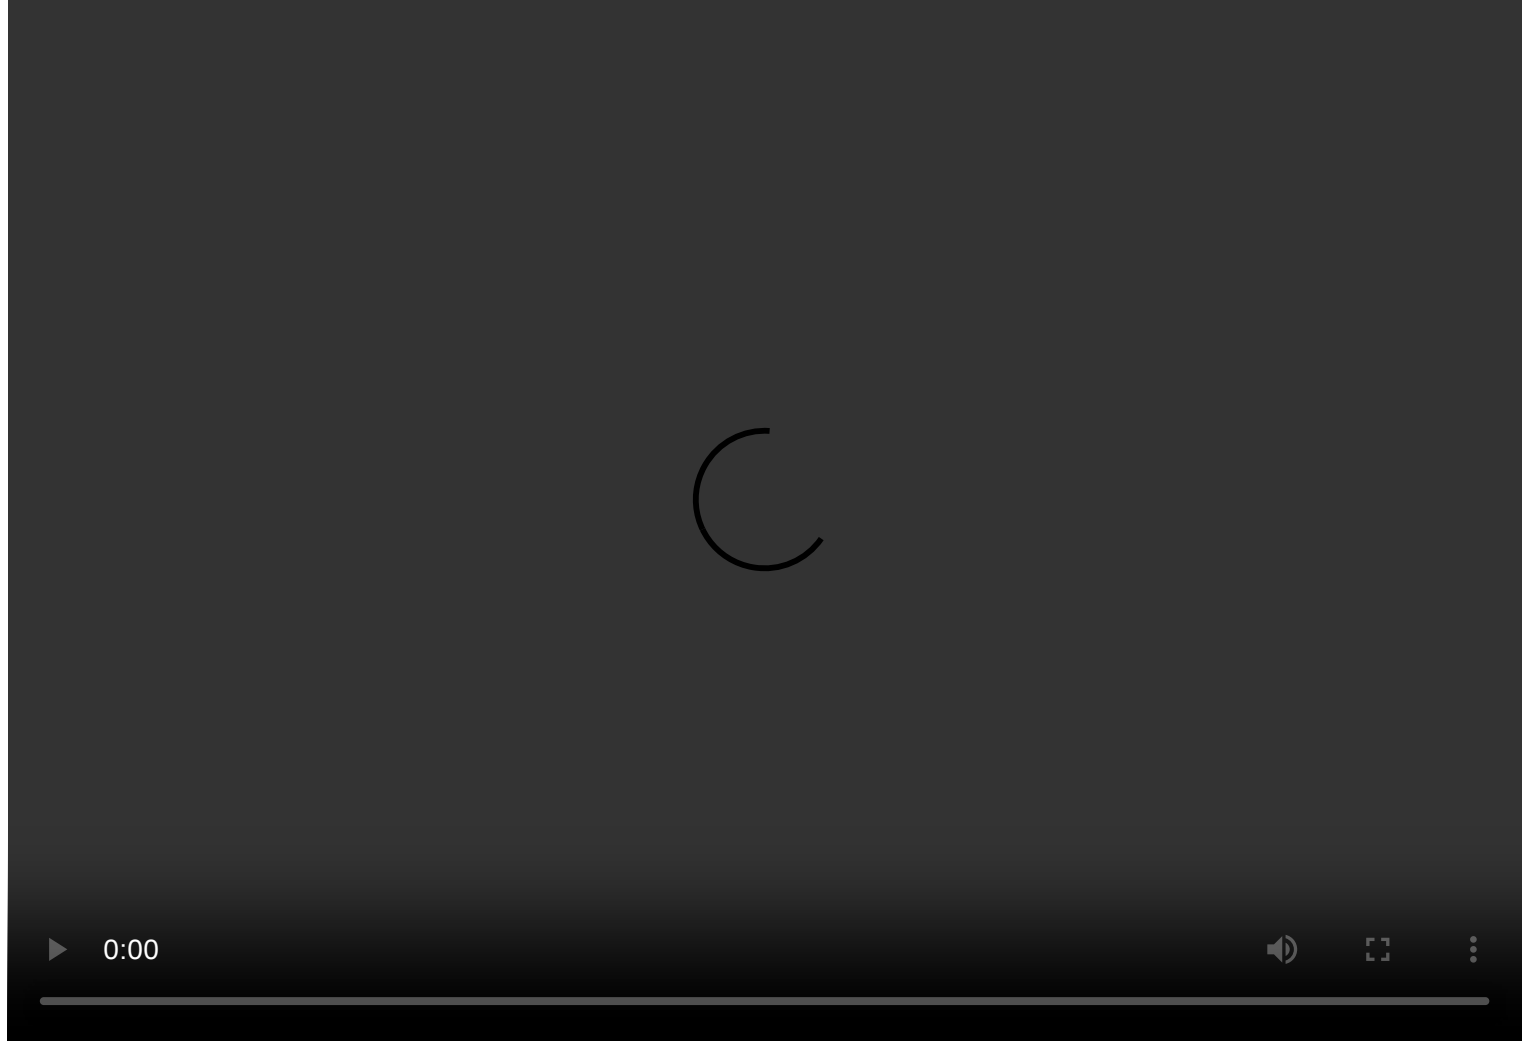

While the launch of DuckAssist means there will, inevitably, be more automated answers popping up in response to users’ queries, DDG notes the feature will still only be available for a minority of searches — since it’s only intended to help with relatively straightforward asks. Phrasing a search

query as a question makes it more likely the feature will appear in search results, it adds.

“Generative artificial intelligence is hitting the world of search and browsing in a big way,” Weinberg writes in a blog post announcing what he says is “the first in a series of generative AI-assisted features we hope to roll out in the coming months”. “At DuckDuckGo, we’ve been trying to understand the difference between what it could do well *in the future* and what it can do well *right now*. But no matter how we decide to use this new technology, we want it to add clear value to our private search and browsing experience.”

More AI powered search and browser features are also in the works from DDG, with additional AI-related news slated for the coming months. (Although he won’t be drawn on what else it has cooking — saying only “stay tuned!”.)

Here’s a clip of the DuckAssist feature in action for a search query that asks “is antarctica a country” — which shows the user being promoted to activate DuckAssist (“ask”) and, on doing that, they receive a summarized natural language answer, displayed above the source (Wikipedia) and a reference to the section of the article it was sourced from:

In its blog post, DDG explains it selected Wikipedia as the main source for DuckAssist since the crowdsourced encyclopedia is already the primary source for its existing Instant Answers feature and, while not foolproof, it assesses it as “[relatively reliable](#) across a wide variety of subjects”.

It also points out Wikipedia has the added benefit of being a public resource “with a transparent editorial process that cites all the sources used in an article, you can easily trace exactly where its information is coming from”.

Plus Wikipedia is of course constantly being updated — expanding the queries DuckAssist can meaningfully respond to. That said, there is still a lag in the knowledge graph — as DDG notes that “right now” the DuckAssist Wikipedia index can be up to “a few weeks old”. (But it says it has plans to “make it even more recent”, in addition to adding more sources “soon”.)

It's worth noting that DDG's current gen Instant Answers aren't always right, either.

At the time of writing, a DDG search for “people in space” generated a neat stack of ten cards of astronauts it suggested are currently up in orbit — however it displayed a photo of US astronaut Kayla Barron twice; once on her own card and once (incorrectly) paired with Germany astronaut Matthias Maurer's card. So error-prone techie shortcuts are nothing new.

Still, the power of generative AI to automate far more interactions — and, in this case, respond to many more types of search queries — could cause a bigger skew in the information landscape by substantially expanding the ability of platforms to apply such shortcuts which boosts the probability of their users running into tech-generated errors.
