APPS

Germ brings end-to-end encrypted messages to Bluesky

A new startup called [Germ](#) is bringing end-to-end encrypted messaging to the Bluesky social network, allowing its users to have a more secure option for chats than [Bluesky's existing DMs](#). After over two years of development, the service is [launching](#) its encrypted DMs for Bluesky into beta this week, with plans to gradually onboard new testers ahead of a public launch.

In time, the [technology that Germ is building](#), much of which is open sourced, could allow Bluesky to introduce encrypted messaging into its own app.

Germ was designed to offer an alternative to existing end-to-end encrypted platforms that dominate globally, like iMessage, Signal, and WhatsApp. Germ takes advantage of newer technologies, like Messaging Layer Security (MLS), a new standard approved by the [Internet Engineering Task Force](#) (IETF), and the [AT Protocol](#) (or ATProto), which powers Bluesky.

IMAGE CREDITS:GERM

IMAGE CREDITS:GERM

However, instead of requiring a user's phone number as some messaging apps do, Germ integrates with ATProto. This allows Germ users to securely chat with friends from Bluesky and the wider open social web, including apps like [Flashes](#) and [Skylight](#), but with added controls over the user experience.

For instance, you can choose to accept DMs from people you follow on Bluesky, or you could configure it so that only you can initiate chats with other people. Plus, when you block a user in Germ, you can choose to block them only in Germ or block them across Bluesky and other ATProto-powered apps as well.

The concept for Germ comes from co-founders [Tessa Brown](#) (CEO), a communications scholar who previously taught at Stanford, and [Mark Xue](#), who worked as a privacy engineer at Apple on technologies like FaceTime and iMessage.

Brown's studies led her to realize that access to private communications was fundamental to the

- Your public ChatGPT queries are getting indexed by Google and other search engines
- The best dating apps aren't even dating apps

health of social networks.

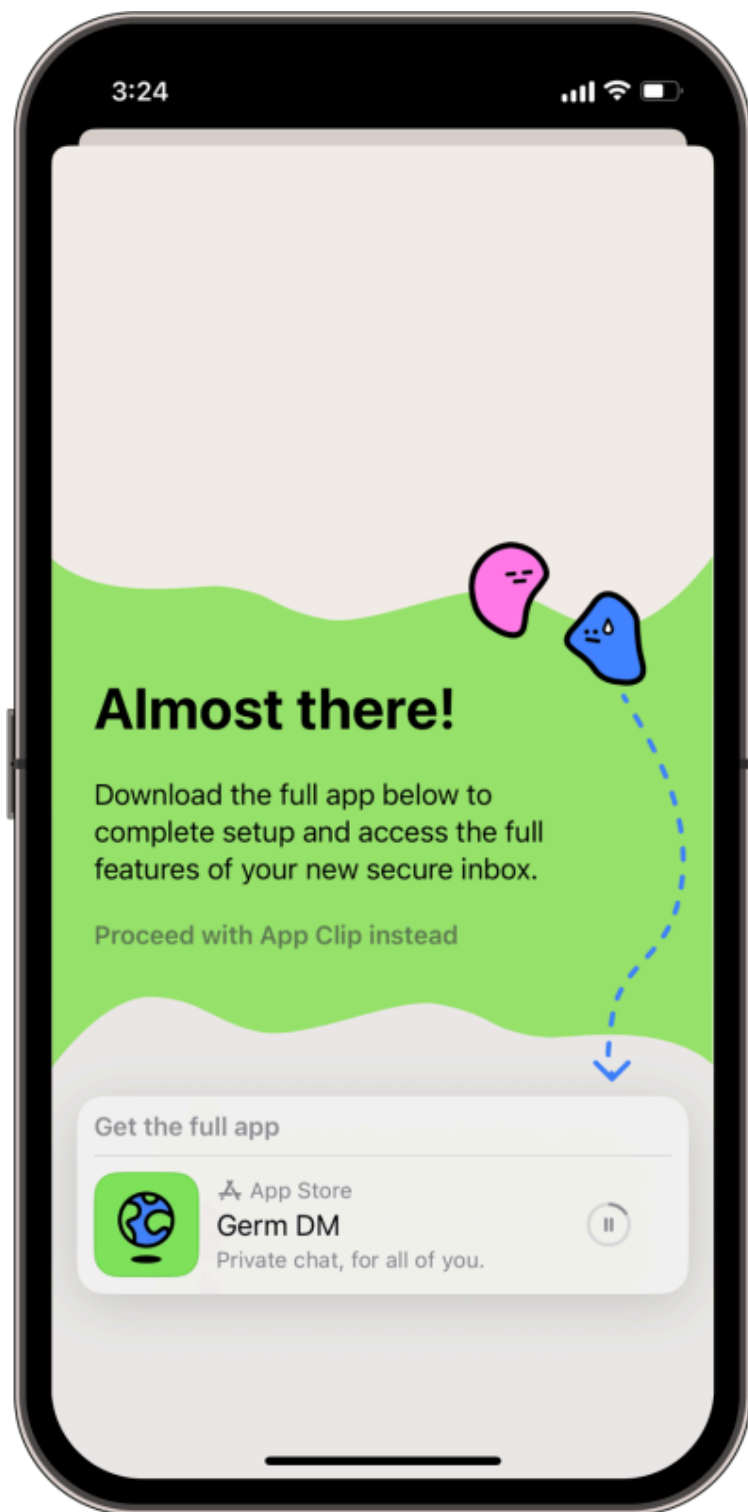

IMAGE CREDITS:GERM

"We know that, psychologically, you can't build a good relationship with people if you feel like you're being stared at and manipulated all the time. And that's really what social media is today," Brown tells TechCrunch. "So I came out of that work with a really strong conviction around end-to-end encrypted messaging as kind of the centerpiece of what I thought was the future of social media and the future of communication," she adds.

Xue, meanwhile, came out of Apple believing that the use of phone numbers and telephony is a dated technology to serve as the basis for secure communications and wanted to build something new.

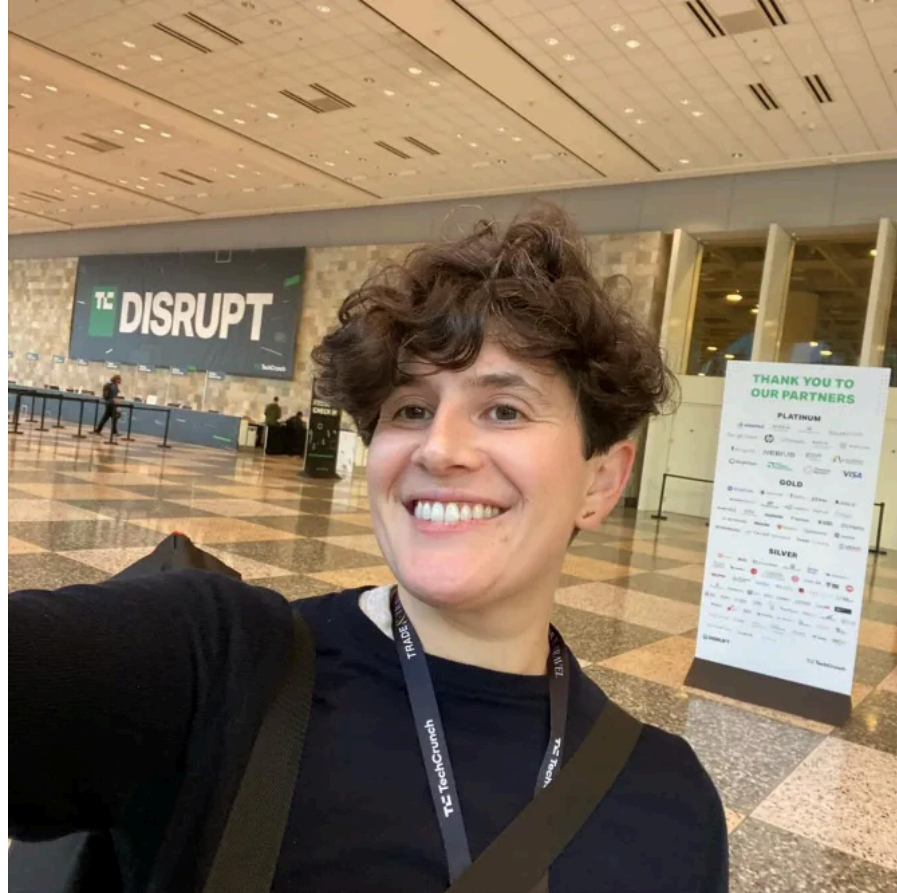

Today, Germ's service works by way of a "magic link," which is generated for you and pasted into your Bluesky bio. When another Bluesky user on iOS clicks this link, they can immediately chat with you without downloading a new app from the App Store. To make this possible, Germ takes advantage of underutilized Apple technology called App Clips, which allow users to run a portion of an app's code on their device without installing the full app.

Today, App Clips are used for miscellaneous one-off-type transactions, like paying for parking via a QR code. But in Germ's case, they allow for quick chats.

While the user experience is simple enough, the technology behind it is not. The link itself is actually a cryptographic key that authenticates the user's ATProto identity to confirm that the user is the person associated with that Bluesky handle.

From the Germ App Clip, you can choose to [install the Germ iOS app](#), which offers more controls, access to your friends list, and now Bluesky pairing.

The pairing feature was somewhat finicky in our tests, but we are running the iOS 26 developer beta, which may be causing complications. (To work around the issue, we started the chat from the App Clip first, before trying to authenticate from the installed app.)

TESSA BROWN, GERM NETWORK CEO.

IMAGE CREDITS: [GERM NETWORK INSTAGRAM](#)

Brown tells TechCrunch that she's excited about building within the Bluesky community, given the app's growing cultural impact, which has attracted big names in U.S. politics, like [Barack Obama](#), [Hillary Clinton](#), and other [representatives, senators, and governors](#), to join.

Given that Germ is ahead of the Bluesky team in building encrypted messaging technology, Brown is hopeful that Germ's protocol could be more broadly adopted by Bluesky and others in the future.

While currently free to use, the Germ app may later introduce a premium subscription upgrade that offers more advanced services, including private AI services, personalization tools, and more.

The four-person startup has raised pre-seed funding from angel investors, including a co-author of MLS and other trust and safety experts. Institutional investors include K5 Global and Mozilla

Ventures. The company hopes to raise additional funds for an Android version in the future.

Beyond Bluesky: These are the apps building social experiences on the AT Protocol

A year ago, [Bluesky was opening up to the public](#) and was known as one of the many [X competitors](#) that emerged after Elon Musk acquired the network formerly known as Twitter. Today, Bluesky's social network has grown to over 36.5 million users, while the technology it's built upon — the AT Protocol (or ATProto for short) — is being used to develop dozens more applications designed to work together as part of an open social web.

The developers behind many of these apps attended the [first conference dedicated to the AT Protocol, ATmosphere](#), held in Seattle in late March 2025. There, they learned what's ahead for ATProto, what challenges still need to be overcome, and [what other things they'll need to think about](#) as they build for this new social app ecosystem. Others attended online, watched the talks and presentations remotely, and participated in a growing Discord chat for community members.

The ATProto community is working to rebuild much of what used to be [Web 2.0](#), an earlier version of the social web that included social media websites, blogs, wikis, video- and photo-sharing sites, and other collaborative and hosted services. This time around, the apps are being built on open technology, not siloed into centralized services that tend to be operated by tech giants.

Bluesky was the first of these services to emerge, but if the open social web movement has any staying power, it won't be the last.

San Francisco | October 27-29, 2025

REGISTER NOW

Spark

IMAGE CREDITS: REELO

[Spark](#) (originally called Reelo) is a video-first app that is built on top of the AT Protocol, not just Bluesky. That allows the app to differentiate itself with a broader feature set that will include support for longer videos, filters, effects, a music library, and, eventually, livestreaming.

Skylight Social

Built by Seattle-based co-founders [Victoria \(“Tori”\) White](#) and [Reed Harmeyer](#), Skylight is built on top of Bluesky, offering features such as likes, follows, comments, and profile pages. Users can follow the app’s active development on [its co-founder’s TikTok page](#) as the team adds more features, including video support.

The app is in testing on [iOS](#) and [Android](#).

IMAGE CREDITS:SKYLIGHT SOCIAL

Pinksky

[Pinksky](#) is another one of many apps trying to build an alternative to Instagram using ATProto. Built by developer [Ramon Souza](#), the app is available on both iOS and [Android](#) and will focus mainly on photo-sharing, like classic Instagram did. The app offers similar features to Instagram, including user profiles, a feed of photos and videos, and a Stories section where posts remain visible for 24 hours.

IMAGE CREDITS:PINKSKY

Bluescreen (TikTok alternative)

[Bluescreen](#), also built by Vogelsang, is an upcoming app that will focus on videos posted to the Bluesky social network.

Videos for Bluesky

The generically named [Videos for Bluesky](#) is another app built on top of Bluesky from “MsZPro,” aka Hoshida Takiyoshi, an indie Japanese developer. Like others, Videos for Bluesky lets you browse videos posted to the Bluesky social network by vertically scrolling in a TikTok-like user interface with familiar Like, Repost, and Reply buttons.

Skyswipe

Another TikTok-like video app for Bluesky, [Skyswipe](#) defines itself by a gesture-first interface, Reddit-style threaded comments, support for custom feeds, bookmarks, reposts, and more. The app is currently available on [TestFlight](#) beta testing.

Skyswipe Beta is live! Skyswipe is a TikTok-style video app for Bluesky with a sleek, gesture-first interface powered by transparent, user-selectable ATProto feeds. 👉 Join the iOS TestFlight: [#testflight.apple.com/join/QbKx1amM#VideoSky](https://testflight.apple.com/join/QbKx1amM#VideoSky) #SkyTok #BlueSkyApps

— [Skyswipe \(@skyswipe.bsky.social\)](#) [2025-05-23T00:38:58.388Z](#)

Omni

[Omni](#) offers a Bluesky client for [iOS](#) designed for sharing short-form videos. The app also includes AI-powered content planning and e-commerce integration. The app is currently in beta testing.

Livestreaming

Streamplace

IMAGE CREDITS:STREAMPLACE

Streamplace is the first livestreaming video service built on top of the AT Protocol. The service, which was recently used to livestream the ATmosphere conference in Seattle, offers a familiar streaming experience with support for high-quality videos, livestreaming, clips, and uploads. All the video content is also cryptographically signed by creators and respects their consent preferences. It is built on the same public key infrastructure as decentralized social networks.

Founded by [Eli Mallon](#), Streamplace was initially backed by his previous employer, Livepeer (another decentralized video platform), which operated a crypto treasury where funds are invested into other projects. That allowed him to get Streamplace off the ground. Now he sees potential in building out a technology that could appeal to creators like Twitch streamers, who would rather connect directly with fans through their own app or website instead of having to split their revenue with Twitch owner Amazon.

Feed builders

Graze

[Grazie](#) is a [startup that lets you easily build](#), customize, publish, and manage Bluesky feeds and, eventually, monetize them with ads, sponsored posts, and subscriptions. The service is working with the [Bluesky](#) firehose, aka the [Jetstream](#), which includes all the public posts on the social network.

Surf

IMAGE CREDITS: FLIPBOARD/SURF

Flipboard's newest app, [Surf](#), lets you build your own custom feeds from across the open web, including not only Bluesky but also Mastodon, RSS, and more. That means you can mix in news articles, blog posts, podcasts, and YouTube feeds into the custom feeds you build in Surf, alongside social posts. You can then use Surf to browse your feeds and others from the community across a range of topics and interests. Surf is still in private beta testing, but [a signup list](#) is available.

SkyFeed

A web-based, TweetDeck-like client for Bluesky, [SkyFeed](#) lets you create a dashboard of your feeds and profiles. However, most of its users come to SkyFeed because it also offers an easy way for even

non-developers to build custom feeds based on lists or regexes.

Communication / social discovery

Germ

IMAGE CREDITS:GERM

Germ's big idea is not just to offer an alternative to your phone messages, like Signal, but to build a social platform where you could discover and connect with others for any reason: marketplace exchanges, dating, social networking, and more. However, it would be one where you were in control of the data you were sharing and could stop that sharing at any time.

Currently an end-to-end encrypted messenger that you can download from the App Store, Germ lets you build and share multiple identities. Plus, you can start chatting with someone on Germ even if they don't have the app installed, thanks to its use of Apple's App Clips technology. This allows you to have a lightweight app experience on your iPhone before you download the full application from the App Store.

Germ was founded by writer and Stanford lecturer [Tessa Brown](#) (CEO) and former Apple privacy engineer [Mark Xue](#) (CTO). The team is now working on a Bluesky integration that would allow users to chat securely with their Bluesky friends.

Roomy

IMAGE CREDITS: ROOMY

A peer-to-peer messaging app built on the AT Protocol, [Roomy](#) is similar in some ways to Discord but taps into open standards. For instance, ATProto is used for social discovery, while [Automerge](#) is used for peer-to-peer discovery. The app is backed by funding from [Skyseed](#) and is currently in alpha testing.

You can log into Roomy with your Bluesky account and direct message other users to engage in chats. The messages are encrypted, but this is an experimental project and not audited, so be aware. Plus, some non-encrypted metadata shows who you were talking to but not the contents of those messages. (In other words, don't swap out Signal for Roomy yet.)

Social trends

IMAGE CREDITS: DAZZLE.FM

Founded by former Stability AI engineers John Sabath and Conner Ruhl, [Dazzle](#) offers a website that makes sense of the firehose of data from Bluesky and organizes it into categories, highlighting the trends across various topics. While much of the early discussion on Bluesky today leans political, Dazzle’s site can help you find other topics and conversations taking place.

Dazzle lets you give it instructions to tune the site to your own interests, too. You could ask it to show you a topic, but without any posts featuring political discussions, for example. That means you could use Dazzle to show you local news, but not national politics, or you could keep your experience focused only on those who are posting with a positive sentiment.

The idea is that you’ll be able to switch between these different modes, generated using AI technology, without actually having to build custom feeds. Instead, you can just type in what you want to see (or not see) into a chat-like interface, then have Dazzle reconfigure itself to offer you posts that match whatever “vibe” you had just requested.

IMAGE CREDITS:SILL

Link aggregation service [Sill](#) lets you keep up with what everyone's talking about on alternative social media sites like [Bluesky](#) and [Mastodon](#) in one place. The service is similar to the older startup [Nuzzel](#), which was acquired by Twitter as part of its [deal for Scroll in 2021](#), then integrated into Twitter's app. Popular with news junkies, Nuzzel helped users keep track of what everyone on Twitter was talking about, reading, and resharing that day.

Sill is also among the early adopters using Bluesky's OAuth for the AT Protocol instead of app passwords, making it easier to log in. Once connected, you'll see the most shared links across your services and the resulting conversations.

Frontpage

IMAGE CREDITS: FRONTPAGE.FYI

A decentralized and federated link aggregator built on ATProto, [Frontpage](#) offers a simple interface for organizing and upvoting interesting posts and links being shared across the social network. It also supports commenting and notifications.

BlueFacts — Bluesky Trends & Insights

[BlueFacts](#)’ app offers a way to discover interesting people and trends on Bluesky, as well as other user rankings, growth statistics, content rankings, feed tools, and more. The app could be helpful in particular for social media managers looking for a better understanding of what’s and who are popular on Bluesky, or anyone else trying to find engaging accounts to follow.

Alternative Bluesky clients

Skeets

Also by Vogelsang, [Skeets](#) is an alternative to Bluesky’s main app that’s optimized for

accessibility and works well on both iPhone and iPad.

Deck.blue

IMAGE CREDITS:DECK.BLUE SCREENSHOT

Another [TweetDeck-style web app](#), [Deck.blue](#) lets you fill your screen with columns featuring your Home feed, Notifications, custom feeds, lists, and more. The app also supports multiple accounts and the scheduling of posts.

Dragonfly

[Dragonfly](#) offers an alternative client app for Bluesky users on macOS and iPad, with support for other platforms still in the works. The app is designed to offer some of the features the main Bluesky app doesn't have, most notably: Bookmarks and support for Drafts. The app is

subscription-based at 99 cents/month, \$9.99/year, or \$24.99 as a one-time purchase.

Beeskie

SCREENSHOT

IMAGE CREDITS: BEESKIE

Built exclusively for Windows users, [Beeskie](#) is a free and open source app that's been built to match the Windows design language. The app is currently in beta and offers a basic set of features, but is continuing to evolve.

Skywalker

IMAGE CREDITS: SKYWALKER

The [Skywalker](#) app brings a third-party Bluesky experience to Android users, which adds a handful of in-demand features like bookmarks and saving drafts.

Boost Blue

SCREENSHOT

IMAGE CREDITS: BOOST BLUE

[Boost Blue](#) is another Bluesky client that focuses on features that Bluesky itself has so far overlooked. This includes things like support for drafts and bookmarks, a way to avoid seeing spoilers, a way to mute reposts from particular users, and a way to preserve your reading position so you can pick up where you left off in the Following feed. Plus, you can add clickable links to your post's text. The app is available as a free download on iOS and Android.

Tokimeki for Bluesky

Built for Android users, [Tokimeki for Bluesky](#) is a third-party Bluesky client offering features like multi-column and multi-account support, drafts, bookmarks, real-time updates, and more.

Events

Smoke Signal

An event and RSVP management system, [Smoke Signal](#) is the Bluesky alternative to something like Eventbrite or Facebook Events. Built on top of ATProto, Smoke Signal supports OAuth, allowing users to discover communities and create and RSVP to events while also keeping hold of their own personal data.

IMAGE CREDITS:SMOKE SIGNAL

OpenMeet

An ATProto-based alternative to Meetup.com, [OpenMeet](#) is an open source platform that allows people to create interest groups, professional networking groups, community groups, and others, and schedule and manage events. Visitors can use the site to find local events and activities and securely communicate with other group members. The service also keeps user information private, it says. OpenMeet is managed by open source contributors.

SCREENSHOT

IMAGE CREDITS:OPENMEET

Blogging

White Wind

A Markdown blogging service for the AT Protocol, White Wind lets you use your ATProto account to log in, then write in Markdown. The service includes tools for uploading images, previewing your post, and more, with everything stored in your account's PDS (personal data service). When you post on Bluesky, those replies are included on your blog automatically.

IMAGE CREDITS:WHITE WIND

Analytics

BlueSkyHunter

Largely [a growth and analytics toolset](#) for Bluesky, [BlueSkyHunter](#) also offers a way to tap into trends

on the social network. One section in the app called Viral Posts showcases the more popular posts. This could help content planners pick up on trends and memes or find templates that are popular with other users that they could adopt.

Fedica

[Fedica](#) offers an online dashboard that allows you to compose and schedule posts across social networks, including Bluesky, Threads, X, Mastodon, and Pixelfed, among others. It also supports more traditional social apps like Facebook, Instagram, TikTok, Pinterest, and YouTube. Included in its plans are a variety of features for social listening, tools for tracking hashtags, keywords, and post reach, as well as those for follower analysis.

FollowBlue

[FollowBlue](#) helps businesses on Bluesky acquire real, targeted followers, track growth analytics, and utilize a follow bot to build an audience. The service offers a tool that categorizes, filters, and finds people to follow, and will unfollow users who don't follow back for a health ratio.

Cross-posting

OpenVibe

IMAGE CREDITS:OPENVIBE

[Openvibe's](#) app allows you to cross-post to multiple social networks at once, including Mastodon, Bluesky, Nostr, and Threads. The app — backed [by Czech Founders VC and Automattic](#) — is designed to be an easy-to-use gateway to the open social web, as you don't have to switch apps constantly to keep up with friends on multiple networks. Instead, you can browse all their updates in a combined timeline.

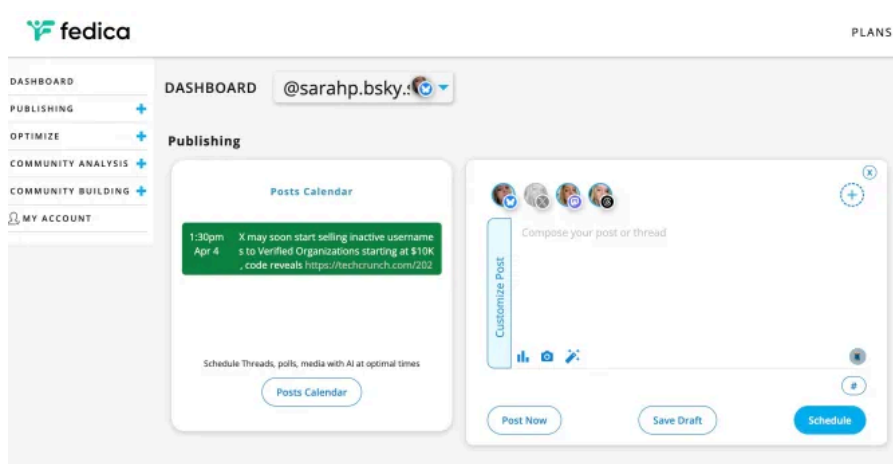

Croissant

IMAGE CREDITS:CROISSANT

Croissant's simple cross-posting app for [iOS](#) offers a way to [reach users on Bluesky, Mastodon, and Threads](#) from one place. The app supports adding things like images, alt text, hashtags, threaded posts, and other service-specific features. Croissant is available as a subscription at

\$2.99/month or \$19.99/year or as a one-time purchase of \$59.99.

Fedica

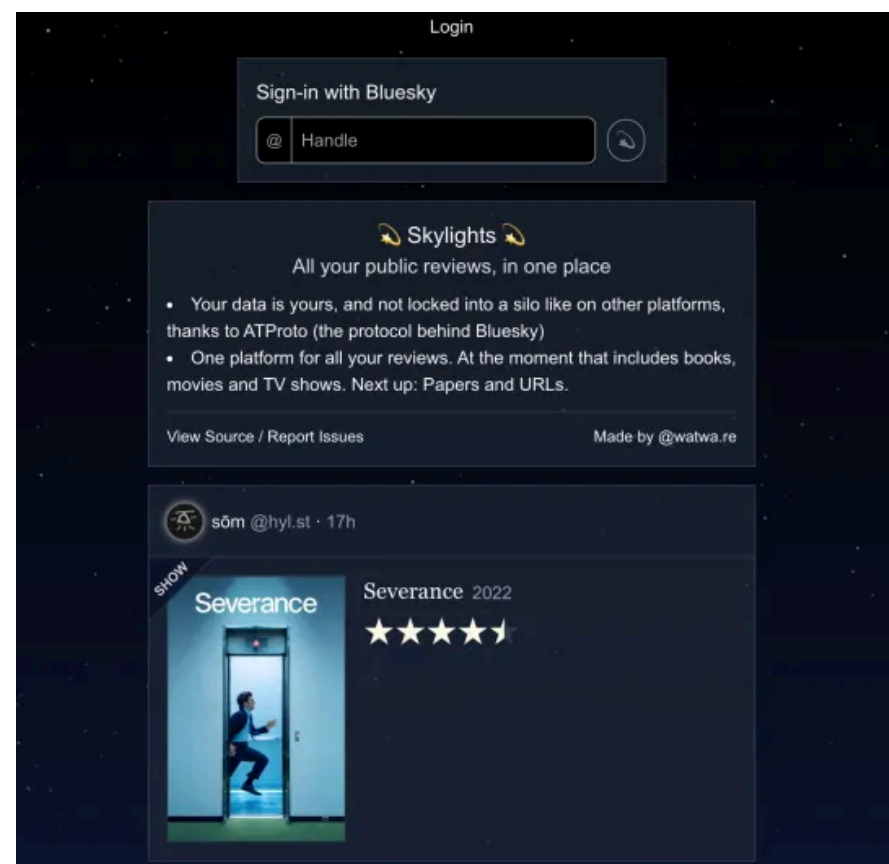

SCREENSHOT

Also listed above under the analytics section, [Fedica](#) offers a cross-posting feature where posts can be scheduled or posted live.

Social reviews

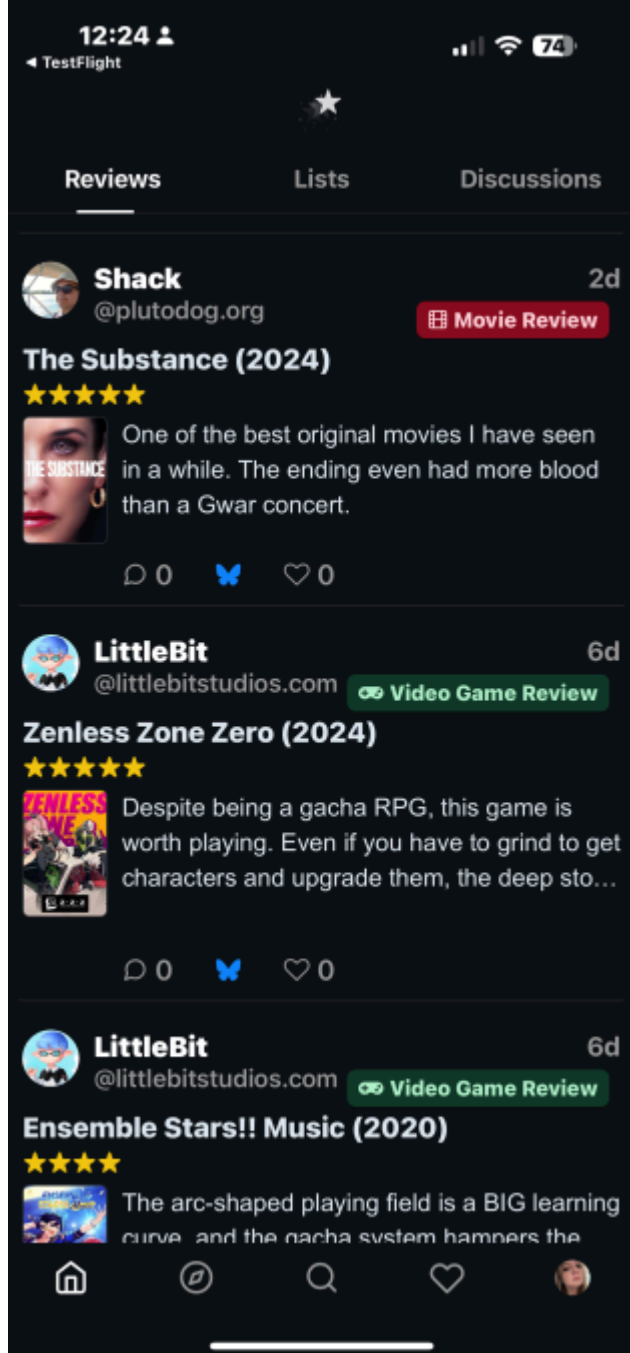

Skylights

Not to be confused with the video app Skylight above, [Skylights](#) is a public reviews platform built on AT Proto where you can review books, movies, and TV shows, with plans to add support for reviewing papers and URLs in the future. Unlike traditional review platforms, the data you share on Skylights is yours, not “locked into a silo,” the website notes.

Popsky

Still in [open beta](#) on iOS, [Popsky](#) is designed to be a place where you can discover and discuss your favorite TV shows, movies, books, and video games. Also built on the AT Protocol, you can mark items as in progress or completed (or watched), manage spoilers, import data from Letterboxd, and more, with reviews and discussions synced back to Bluesky’s social network.

Bluecast

Bluecast's real-time audio streaming service for Bluesky users lets anyone start streaming without special equipment. The service's web app works across platforms, including mobile and desktop, and includes features like multi-guest streaming, streaming karaoke, background music and sound effects, visual effects, and other advanced features.

BLUECAST

English

Bring Your Sound to the Bluesky Community!

Bluecast - A Real-Time Audio Streaming Service for Bluesky Users

Sign in

Sign-In Method Has Changed

Bluecast now supports OAuth. Please note that the sign-in method has changed. When you sign in, you will be redirected to Bluesky. After signing in with your Bluesky account, you can access Bluecast. Please note that App Passwords will no longer be available.

Sign in with Bluesky

With just a Bluesky account, anyone can easily start streaming audio right away. No special equipment is required. As a web app, it works on any OS or device, allowing you to stream from various environments, whether it's a smartphone, PC, or more.

Enjoy Seamless Communication

With minimal latency for both audio and chat, conversations flow naturally, making communication smooth and engaging. Even those new to streaming can easily interact with comments and enjoy a lively streaming experience.

Multi-Guest Streaming Feature

By subscribing to the Pro plan, you can invite guests to join your stream. Add up to 9 guests and have lively conversations with everyone while streaming. Guests do not need to subscribe to the Pro plan to join.

Karaoke Streaming

Streaming karaoke is easy, even without special equipment. All you need is a pair of earphones or headphones. With a comprehensive contract with JASRAAC, you can stream karaoke, play instruments, or perform with no copyright issues.

Background Music and Sound Effects

A wide variety of background music and sound effects are available by default. With background music, you don't need to worry if the conversation slows down. Listeners can relax and enjoy your stream. Using sound effects can make your stream feel like a radio show or add a nice touch to your broadcasts.

IMAGE CREDITS : BLUECAST

Games/experiences

Twigbit Games' SkyMuseum

IMAGE CREDITS: TWIGBIT GAMES/SKYMUSEUM

Built on Bluesky, [SkyMuseum](#) lets you interact with other artists by hosting your own online art gallery. The current app lets you host up to 32 players who can log in and view your art in a museum-like experience, similar to those on gaming platforms like Roblox.

Utilities

Cred.blue

[Cred.blue's](#) service gives you an easy way to generate a “score” based on a user’s identity in the ATProto ecosystem. While in some ways the idea of scoring someone’s social activity makes this sound like a [Klout](#) for the open social web, Cred.blue’s goal is to help users understand more about the people they follow and whether their account is healthy and active. The scoring takes into account a user’s public data, like their posts’ content, likes, social graph, and more, as well as their involvement with the larger ATProto ecosystem. Users can also see where they rank on a [Leaderboard](#) that spans Bluesky at the AT Protocol network.

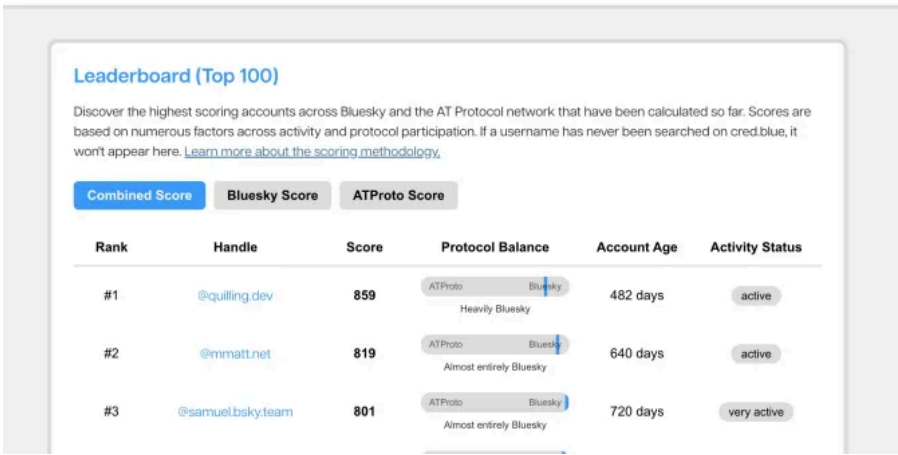

IMAGE CREDITS: CRED.BLUE

Mutesky

The service offered by [Mutesky](#) lets you bulk manage Bluesky mutes — meaning topics you don’t want to see as part of the Bluesky experience — in one convenient dashboard. Here, you can control whether or not you want to see things like political discourse, social issues, global affairs, religion, healthcare, and others when browsing the Bluesky social network. You can even more narrowly dig into niche topics within categories to specify which subtopics should be muted.

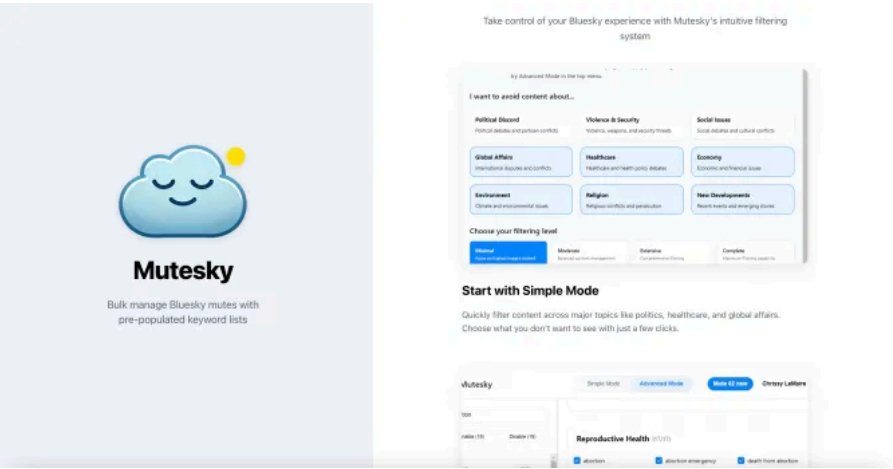

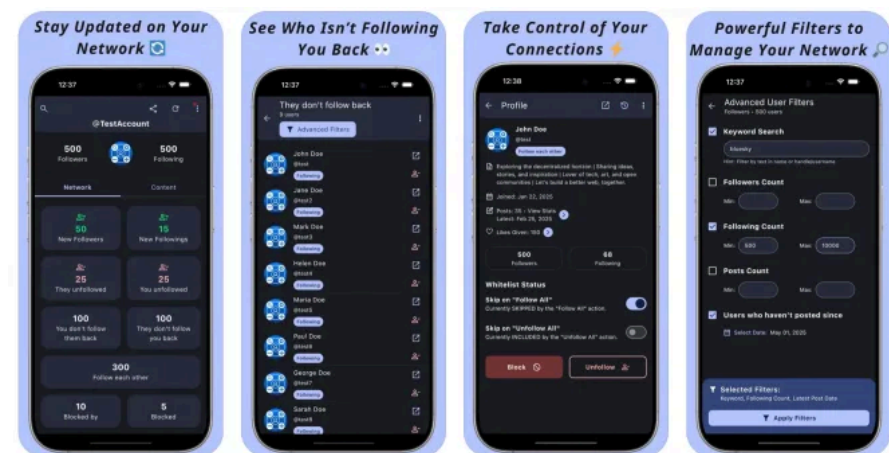

IMAGE CREDITS: MUTESKY

Listifications

This utility is simply [an account](#) you follow on Bluesky that will notify you through a DM when someone on the platform adds you to a Starter Pack, block list, or if someone blocks your account

directly. It can help people who are trying to grow their following — or even just those who want to know what people think of them!

Bluesky Tracker – Manager

SCREENSHOT

IMAGE CREDITS: BLUESKY TRACKER

This app for both [iOS](#) and [Android](#) lets you keep track of your own popularity and stats on Bluesky by offering a dashboard where you can view real-time followers and unfollowers statistics, and other metrics. The app can track your posts and stats, show you who's blocking you, track your lokes, and let you bulk follow or unfollow.

Other apps

Woosh

A project built by the team at Federation Studio, [Whoosh](#) is building the Linktree for the open social web. The service allows users to share and showcase their online presence in one place, which can include everything from their open social profiles on Bluesky to those on larger platforms like TikTok. However, all the data created on Woosh is saved to your Bluesky or AT Protocol user account, which means you could publish your own App View to render your page the way you want, or use other services to do so in the future.

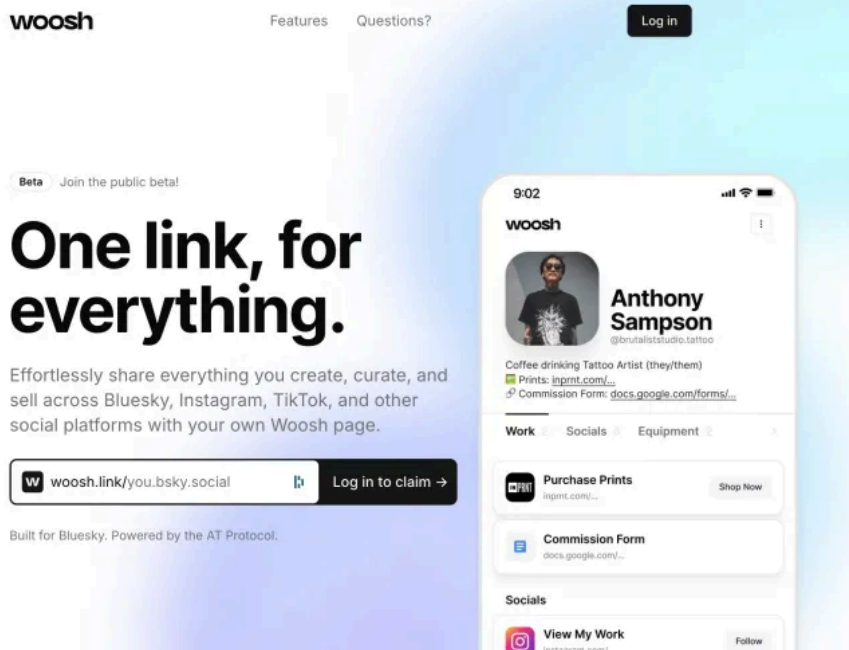

IMAGE CREDITS: WOOSH

AzSky

An open social alternative to a discussion forum site like Reddit, [AzSky](#) is powered by Bluesky. Users can join communities and engage in discussions with others who share their interests across topics like news, technology, gaming, movies, books, and more. You can also track “trending” conversations taking place across Bluesky from AzSky, which are those discussions that have hundreds (or even thousands) of comments.

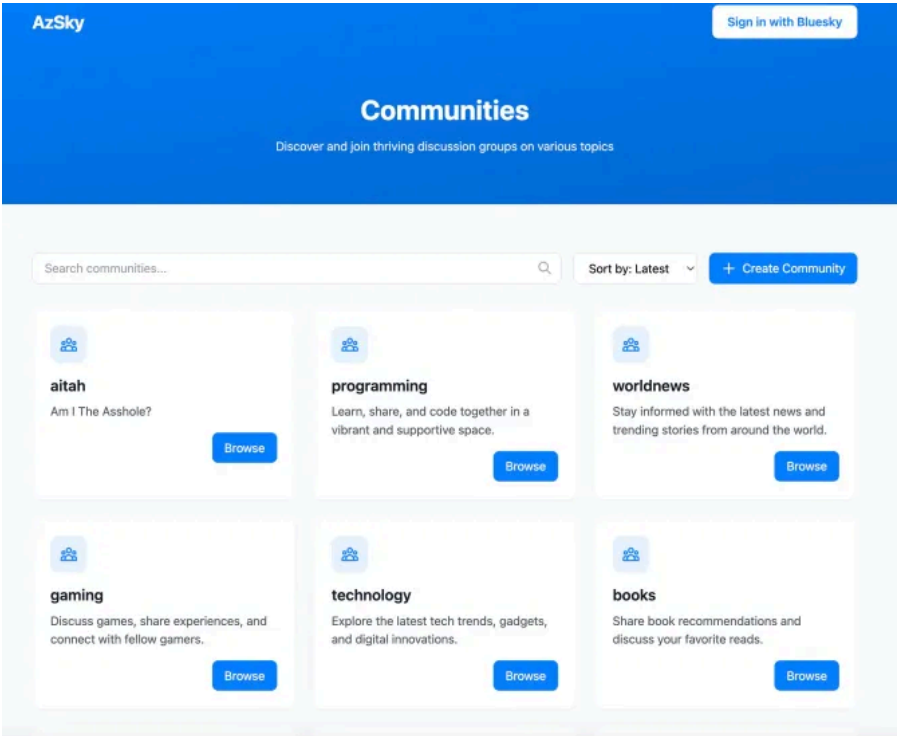

IMAGE CREDITS: AZSKY

Flushes

This silly social app, [Flushes](#), lets you post a “flush” when you’re in the bathroom, which is published on AT Proto. Why a decentralized bathroom app? Why not!

Navyfragen — Anonymous Inbox

Similar to apps like [NGL](#) for Instagram, [this new app](#) lets you sign up with your Bluesky account and create an inbox where users can ask you anonymous questions. You can then post your answers to Bluesky for your followers to see. The system is protected against spam by Anubis’s bot detection service and offers its [source code](#) on GitHub.

SkySpace

SCREENSHOT

IMAGE CREDITS: SKYSPACE

Still a work-in-progress, [SkySpace](#) is building a customizable social app for using Bluesky that is meant to resemble MySpace. The app will allow

users to edit their profiles, adding music and interests, and keep track of their online friends.

This was originally published on March 30, 2025, and was last updated on June 13, 2025.
