“Shen is a highly technical founder, and he is obsessed with pushing boundaries of video understanding and intelligence,” said Misha Gordon-Rowe, a partner at Susa Ventures. “Memories.ai can unlock a lot of first-party visual intelligence data with its solution. We felt that there

was a gap in the market for a visual intelligence company that could provide a comprehensive solution for businesses.

Samsung is a leading investor in AI solutions, and it is looking for ways to integrate AI into its products and services.

“One of the challenges we faced was that we could not find a solution that could provide a comprehensive solution for businesses.

the cloud, and we were looking for a solution that could provide a comprehensive solution for businesses. We were looking for a solution that could provide a comprehensive solution for businesses.

queries) with segmentation and tags. There is also an aggregation layer that summarizes data from the index, helping create reports.

Currently, the startup caters to two kinds of companies: marketing and security. Marketing companies can use the startup’s tools to look up trends related to their brands on social media, and identify what kind of video they want to make.

Memories.ai also provides tools for marketers to create those videos.

The company is also working with security companies to help them analyze security footage to determine potentially dangerous actions by people in the videos by reasoning through patterns.

The company currently employs 15 people, and it plans to use the fund to augment its team and improve its search.

Memories.ai is going up against similar startups, like [mem0](#) and [Letta](#), which are working on providing a memory layer for AI models, though

they offer limited video support at the moment. It also has to contend with companies like TwelveLabs and Google, which have been working on helping AI models understand videos.

Shen, however, feels his company's solution is more horizontal, which would let it work with different video models as well.

ZeroEntropy joins a growing wave of infrastructure companies hoping to use retrieval-augmented generation (RAG) to power search for the next generation of AI agents. Competitors range from MongoDB's VoyageAI to early fellow YC startups like Sid.ai.

"We've met a lot of teams building in and around RAG, but Ghita and Nicolas' models outperform

What that means is that — unlike a search product for enterprise employees like Glean — ZeroEntropy is strictly a developer tool. It quickly grabs data, even across messy internal documents. Hour Alami likens her startup to a "Supabase for search,"

referring to the popular open source database that automates much of the database management.

“Right now, most teams are either stitching together existing tools from the market or dumping their entire knowledge base into an LLM’s context window. The first approach is time-consuming to build and maintain,” Hourir Alami said. “The second approach can cause compounding errors. We’re building a developer-first search infrastructure —

looks for answers in a knowledge base, it grabs the most relevant information first.

More than 10 early-stage companies building AI agents across verticals such as healthcare, law, customer support, and sales are already using ZeroEntropy, she adds.

Born and raised in Morocco, Hourir Alami left home at 17 to pursue engineering education in France, attending École Polytechnique, a prestigious military and mathematics-focused institution. There, she discovered her love for machine learning.

She moved to California two years ago to complete a master's in mathematics at UC Berkeley, where she deepened her interest in building intelligent systems.

Before founding her startup, Hourir was involved in building and launching several products, often converting her ideas into reality. She's a strong believer in the mainstreaming of AI, and is currently working on trying to make AI more accessible to everyone, realizing the right combination of factors to make it truly useful.

In a field where she's been working for over 25 years, Hourir has seen many changes. CEOs build products that are often the result of the hardest work, and she's seen many startups stay the course.

"There's a lot of hype around AI," she said. "But it's not just about the technology; it's about how you're using it. You need to let anyone use it, not just those pursuing it."

She also stays connected to her roots by giving talks at high schools and universities in Morocco, aiming to inspire more young girls to pursue STEM.
