The uproar over Vogue's AI-generated ad isn't just about

fashion

‘It’s just so much cheaper. Brands need a lot of content.’

Rebecca Bellan, Dominic-Madori Davis

6:00 AM PDT · August 3, 2025

[Sarah Murray](#) recalls the first time she saw an artificial model in fashion: It was 2023, and a beautiful young woman of color donned a Levi’s [denim overall dress](#). Murray, a commercial model herself, said it made her feel sad and exhausted.

The iconic denim company had teamed up with the AI studio Lalaland.ai to create “diverse” digital fashion models for more inclusive ads. For an industry that has failed for years to employ diverse human models, the backlash was swift, with New York Magazine calling the decision “[artificial diversity](#).”

“Modeling as a profession is already challenging enough without having to compete with new new digital standards of perfection that can be achieved with AI,” Murray told TechCrunch.

IMAGE CREDITS: GUESS

Two years later, her worries have compounded. Brands continue to experiment with AI-generated models, to the consternation of many fashion lovers. The latest uproar came after Vogue’s July print edition featured a Guess ad with a typical model for the brand: thin yet voluptuous, glossy blond tresses, pouty rose lips. She exemplified North American beauty standards, but there was one problem — she was AI generated.

[The internet buzzed for days](#), in large part because the AI-generated beauty showed up in Vogue, the fashion bible that dictates what is and is not acceptable in the industry. The AI-generated model was featured in an advertisement, *not* a Vogue editorial spread. And Vogue told TechCrunch the ad met its advertising standards.

To many, an ad versus an editorial is a distinction without a difference.

TechCrunch spoke to fashion models, experts, and technologists to get a sense of where the industry is headed now that Vogue seems to have put a stamp of approval on technology that's poised to dramatically change the fashion industry.

Tech and VC heavyweights join the Disrupt 2025 agenda

Netflix, ElevenLabs, Wayve, Sequoia Capital — just a few of the heavy hitters joining the Disrupt 2025 agenda. They're here to deliver the insights that fuel startup growth and sharpen your edge. Don't miss the 20th anniversary of TechCrunch Disrupt, and a chance to learn from the top voices in tech — grab your ticket now and save up to \$675 before prices rise on August 7.

They said the Guess ad drama highlights questions arising within creative industries being touched by AI's silicon fingers: When high-quality creative work can be done by AI in a fraction of the time and cost, what's the point of humans? And in the world of fashion, what happens to the humans — the models, photographers, stylists, and set designers — performing those jobs?

“It's just so much cheaper”

Sinead Bovell, a model and founder of the [WAYE](#) organization who [wrote about CGI models for Vogue](#) five years ago, told TechCrunch that “e-commerce models” are most under threat of automation.

E-commerce models are the ones who pose for advertisements or display clothes and accessories for online shoppers. Compared to high-fashion

models, whose striking, often unattainable looks are featured in editorial spreads and on runways, they're more realistic and relatable.

"E-commerce is where most models make their bread and butter," Bovell said. "It's not necessarily the path to model fame or model prestige, but it is the path for financial security."

SINEAD BOVELL, FOUNDER AND MODEL. IMAGE CREDITS: SINEAD BOVELL

"AI now lets you start with a flat-lay product shoot, place it on a photorealistic virtual model, and even position that model in a coherent setting, producing images that look like genuine fashion editorials," he told TechCrunch.

Brands, in some ways, have been doing this for a while, he said. Mougnot, who is French, cited the French retailer Veepee as an example of a company that has used virtual mannequins to sell clothes since at least 2013. Other notable brands like [H&M](#), [Mango](#), and Calvin Klein have also resorted to AI models.

Amy Odell, [a fashion writer](#) and author of a recently published [biography on Gwyneth Paltrow](#), put it more simply: "It's just so much cheaper for [brands] to use AI models now. Brands need a lot of content, and it just adds up. So if they can save money on their print ad or their TikTok feed, they will."

That fact is running in direct contrast to the pressure many brands feel to automate such shoots. Paul Mougnot, an art technologist who has worked with luxury brands, said it's simply expensive to work with live models, especially when it comes to photographing them in countless garments, shoes, and accessories.

PJ Pereira, co-founder of AI ad firm [SilverSide AI](#), said it really comes down to scale. Every conversation he's had with fashion brands circles around the fact that the entire marketing system was built for a world where brands produced just four big pieces of content per year. Social media and e-commerce has changed that, and now they need anywhere from 400 to 400,000 pieces; it's too expensive for brands, especially small ones, to keep up.

"There's no way to scale from four to 400 or 400,000 with just process tweaks," he added. "You need a new system. People get angry. They assume this is about taking money away from artists and models. But that's not what I've seen."

From "diverse" models to AI avatars

Murray, a commercial model, understands the cost benefits of using AI models, but only to an extent.

She lamented that brands like Levi's claim AI is only meant to supplement human talent, not take away.

"If those [brands] ever had the opportunity to stand in line at an open casting call, they would know about the endless amounts of models, including myself, that would dream of opportunities to work with their brands," she said. "They would never need to supplement with anything fake."

She thinks such a shift will impact "non-traditional" — think, diverse — commercial models, such as herself. That was the main

SARAH MURRAY. IMAGE CREDITS: COURTESY OF SARAH MURRAY

problem with the Levi's ad. Rather than hiring diverse talent, it artificially generated it.

Bovell calls this “robot cultural appropriation,” or the idea that brands can just generate certain, especially diverse, identities to tell a brand story, even if the person who created the technology isn't of that same identity.

And though Pereira argues that it's unrealistic to shoot every garment on every type of model, that hasn't calmed the fears many diverse models have about what's to come.

“We already see an unprecedented use of certain terms in our contracts that we worry indicate that we are possibly signing away our rights for a brand to use our face and anything recognizable as ourselves to train their future AI systems,” Murray said.

Some see generating likenesses of models as a way forward in the AI era. [Sara Ziff](#), a former model and founder of the Model Alliance, is working to pass the [Fashion Workers Act](#), which would require brands to get a model's clear consent and provide compensation for using their digital replicas. Mougnot said this lets models appear at several shoots on the same day and possibly generate additional income.

That's “precious when a sought-after model is already traveling constantly,” he continued. But at the same time, whenever an avatar is hired, human labor is replaced. “What few players gain can mean fewer opportunities for many others.”

If anything, Bovell said the bar is now higher for models looking to compete with the distinctive and the digitized. She suggested that models use their platforms to build their personal brands, differentiate themselves, and work on new revenue streams like podcasting or brand endorsements.

“Start to take those opportunities to tell your unique human story,” she said. “AI will never have a unique human story.”

That sort of entrepreneurial mindset is becoming table stakes across industries — from journalism to coding — as AI creates the conditions for the most self-directed learners to rise.

Room for another view

ARTCARE AI-GENERATED MODEL .

Mouginot sees a world where some platforms stop working with human models altogether, though he also believes humans share a desire for the “sensual reality of objects, for a touch of imperfection and for human connection.”

“Many breakthrough models succeed precisely because of a distinctive trait, teeth, gaze, attitude, that is slightly imperfect by strict standards yet utterly charming,” he said. “Such nuances are hard to erode in zeros and ones.”

This is where startup and creative studio [Artcare](#) thrives, according to Sandrine Decorde, the firm’s CEO and co-founder. She refers to her team as “AI artisans,” creative people who use tools like Flux from [Black Forest Labs](#) to fine-tune AI-generated models that have that touch of unique humanity.

Much of the work Decorde’s firm does today involves producing AI-generated babies and children for brands. Employing minors in the fashion

industry has historically been a gray area rife with exploitation and abuse. Ethically, Decorde argues, bringing generative AI to children’s fashion makes sense, particularly when the market demand is so high.

“It’s like sewing; it’s very delicate,” she told TechCrunch, referring to creating AI-generated models. “The more time we spend on our datasets and image refinements, the better and more consistent our models are.”

Part of the work is building out a library of distinctive artifacts. Decorde noted that many AI-generated models — like the ones created by [Seraphinne Vallora](#), the agency behind Vogue’s Guess ad — are too homogenous. Their lips are too perfect and symmetrical. Their jawlines are all the same.

“Imagery needs to make an impact,” Decorde said, noting that many fashion brands like to work exclusively with certain models, a desire that has spilled over into AI-generated models. “A model embodies a fashion brand.”

Pereira added that his firm combats homogeneity in AI “with intention” and warned that as more content gets made by more people who aren’t intentional, all of the output feeds back into computer models, amplifying bias.

“Just like you would cast for a wide range of models, you have to prompt for that,” he said. “You need to train [models] with a wide range of appearances. Because if you don’t, the AI will reflect whatever biases it was trained on.”

An AI future is promised, but uncertain

The usage of AI modeling technology in fashion is mostly still in its experimental phase, Claudia Wagner, founder of modeling booking platform Ubooker, told TechCrunch. She and her team saw the Guess ad and said it was interesting technically, but it wasn’t impactful or new.

“It feels like another example of a brand using AI to be part of the current narrative,” she told TechCrunch. “We’re all in a phase of

more than a million views with mostly negative comments.

“But if you look past the comments, you see that there’s a silent majority — almost 20x engagement — that vastly outnumber the criticism,” he

continued. “The click-through rate was 30x the number of complaints, and the product saw a steep hike in sales.”

He, like Wagner, doesn’t think AI models are going away anytime soon. If anything, the process of using AI will be integrated into the creative workflow.

“Some brands feel good about using fully artificial models,” Pereira said. “Others prefer starting with real people and licensing their likeness to build synthetic shoots. And some brands simply don’t want to do it — they worry their audiences won’t accept it.”

Wagner said what is becoming evident is that human talent remains central, especially when authenticity and identity are part of a brand’s story. That’s especially true for luxury heritage brands, which are usually slow to adopt new technologies.

Though Decorde noted many high-fashion brands are quietly experimenting with AI, Mougnot said many are still trying to define their AI policies and are avoiding fully AI-generated people at the moment. It’s one reason why Vogue’s inclusion of an AI model was such a shock.

Bovell pondered if the ad was Vogue’s way of testing how the world would react to merging high fashion with AI.

So far the reaction hasn’t been great. It’s unclear if the magazine thinks it can ride out the backlash.

“What Vogue does matters,” Odell said. “If Vogue ends up doing editorials with AI models, I think that’s going to make it okay. In the same way the industry was really resistant to Kim Kardashian and then Vogue featured her. Then it was okay.”

The Netflix For Designer Clothes, Rent The Runway Raises \$20M From Vogue-Publisher Condé Nast And Kleiner Perkins

Leena Rao — 5:59 AM PST · November 30, 2012

[Rent The Runway](#), a Netflix for designer clothes, accessories and jewelry, has raised \$20 million in funding led by Condé Nast Publications, with all existing investors participating in the fundraising round including Bain Capital Ventures, Highland Capital Partners and Kleiner Perkins Caufield & Byers. To date, Rent the Runway had raised more than \$51 million in venture capital.

Rent The Runway allows women to rent designer clothes and accessories at a marked down price. Once you pick a design on the site that you'd like to wear, you can schedule a delivery date. Rent The Runway will send two sizes, to ensure that you receive a dress that fits. Rentals on the site run from \$50 to \$200 for a four night loan, or 10% of the retail price.

An investment from Condé Nast, who is the publisher behind Vogue, Lucky, Glamour and other fashion magazines, is a big deal for the fashion startup. The investment is not only a financial deal, but also represents a meaningful product partnership.

“We are excited about diversifying our portfolio through an association with Rent the Runway which allows our readers a new way to access luxury brands and we look forward to creating unique consumer-centric programs with them,” said Bob Sauerberg, president of Condé Nast, who will join Rent the Runway’s Board of Directors.

Condé Nast has also made investments in Flite, Moda Operandi, Unified, Visible Measures and Trigger Media, and recently acquired Ziplist.

Rent the Runway has over 3 million members and 170 designer brands, and recently introduced the first-ever online social shopping platform – Our Runway – which allows women to shop based on user-generated photos of real women with their

similar body type, rather than the typical model image.

As we [reported a few weeks ago](#), the new search feature allows women to shop based on user-generated photos of real women with similar body types. The flagship feature of the launch is a Find Women Like Me tool, which allows women to enter their height, bust size, dress size and age, in order to view thousands of diverse women with comparable shapes in dresses available for rent.

The search feature takes up to 4 data points (dress size, age, height and bust size) and buckets these characteristics into a vector that maps to one of 864 “canonical types,” down from over 100,000 possible unique combinations. The startup says it matches most precisely to dress size, which Rent The Runway believes is the most important characteristic in similarity.

The feature also allows members to comment on a customer's photo, asking questions about the fit or

style of a dress, or to simply compliment the look.

Jennifer Hyman, CEO and co-founder of Rent the Runway, says the that new financing will enable more technology to be added to Rent The Runway’s platform. “We want to disrupt and revolutionize the retail industry and the backbone of this is technology,” she explains to us in an interview. She says that across many verticals including textbooks (Chegg), movies and TV shows (Netflix), apartments (Airbnb); there has been a shift towards a rental model for consumers.

As for Condé Nast, Hyman says that Rent The Runway provides broader access to the aspirational luxury fashion that the publishing house promotes via its flagship titles. “This is a partnership beyond just being an investor. We will be integrating with their organization to take advantage of marketing and sales prowess they have, and help create brand awareness for Rent The Runway.”

An investment from Condé Nast (as well as previous investors) is certainly a validation that the model is working. I, for one, am all for making designer clothes more accessible to the masses.
