Multiverse Computing lands \$215M in major quantum VC deal

By [Leah Hodgson](#)

Published June 12, 2025

[Multiverse Computing](#) has closed a \$215 million Series B to improve the efficiency of large language models (LLMs) in one of this year's largest quantum computing VC rounds.

[Bullhound Capital](#) led the round, which also saw participation from investors including [HP Tech Ventures](#), [SETT](#) and [Forgepoint Capital International](#). The Spanish startup is now

reportedly valued at over \$500 million—up almost fivefold from its €25 million Series A price tag last year.

Launched in 2019, Multiverse develops quantum software to solve complex problems in finance, energy and now AI. Its flagship product, CompactifAI, compresses AI models by up to 95% without compromising accuracy.

Typically run on cloud-based infrastructure, LLMs are expensive to train and run due to their large computational and energy needs. CompactifAI is designed to make LLMs run faster and more cheaply by using a mathematical tool originating from quantum mechanics—tensor networks.

Tensor networks break down big, complex data structures into smaller, connected pieces that are easier to process. This approach helps identify and eliminate redundancies within an LLM's parameters, resulting in a smaller and faster model that still retains its original performance.

Multiverse estimates that CompactifAI results in a 50% to 80% reduction in inference costs and that models can run up to 12x faster than non-compressed versions. Compressed models can run on the cloud, in private data centers and even directly on devices such as PCs, phones and drones.

Quantum computing has been gaining traction with VC investors in recent years, with 2025 on course for record levels of funding. According to PitchBook data, \$1.7 billion has already been invested this year globally across 88 deals.

Quantum computing draws in VC funding
